

Michael Clayton & Associates

The **existing view** to the west-southwest toward the existing 115 kV subtransmission line that is to be replaced by the Proposed Project, from Faircliff Street, just west of Finley Avenue in the Seneca Springs residential development. This viewpoint was selected because it passes adjacent to existing and developing residences. The existing wood pole H-frame subtransmission line structures are prominent vertical features in the developing suburban landscape. The skylining (extending above the horizon) of the transmission structures exacerbates their visual prominence.
