1 Executive Summary

Closing the Digital Divide is an important goal for the California Public Utilities Commission. State-financed programs, such as the California Advanced Services Fund and the California Emerging Technology Fund, exist to increase access to broadband and promote adoption and use of broadband.

The basis for this report is the Federal Communication Commission (FCC)'s Form 477¹, a semi-annual report filed by Internet service providers that shows how many wireline and fixed wireless connections they claim per census tract. This report does not include mobile subscriptions because they are not always reported at the census tract level, but rather at the statewide level. The data contained in the FCC's Form 477 are imperfect; therefore we make an effort in this paper to highlight areas we think are incorrect or misleading. Here are our findings:

1. There was over a 30% gap between average rural broadband penetration and large urban broadband penetration. Less than half of rural households were connected to broadband in 2012. About a quarter of that difference was due to lack of broadband access. Eight urban counties had penetration rates greater than 80%, whereas seven rural counties had penetration rates below 50%.
2. Like in rural counties, we observed low penetration (below 50%) also within large urban areas. Relatively lower income areas of Los Angeles and Sacramento had lower penetration rates than corresponding areas in San Francisco and San Diego.
3. The penetration rate for the state overall increased nearly 4% from 2011 to 2012, with households subscribing to faster plans. With one exception, penetration increased in the counties.
4. Compared to the U.S. overall, California had more connected households on a per household basis, but compared to other states, California ranked 14th in terms of broadband availability. But California's total connected population exceeded the combined total of the top 5 states.

Overview of Terms

This section presents the definition of common terms used throughout this report. Please note that some of these terms are similar, but have different meanings

Adoption Rate	Number of residential broadband subscriptions divided by households with broadband available
Availability	Number of households with broadband available, according to CPUC Broadband Availability data as of June 30, 2012. More details on this are in Section 5.
Broadband	Internet connection of at least 768 Kbps (Kilobits per second) download and 200 Kbps upload
Penetration Rate	Number of residential broadband subscriptions divided by total households
Subscriptions	Number of reportable connections according to the FCC's Form 477 report.
Total Households	Number of occupied housing units. More details on this are in Section 5.

¹ Data as of June 30, 2012. The FCC's report, "Internet Access Services: Status as of June 30, 2012" analyzes broadband subscription data nationwide. The report is available at <http://www.fcc.gov/reports/internet-access-services-63012>

2 Penetration Rate vs. Adoption Rate

Because of how we calculate the adoption rate, fluctuations in broadband availability can negatively affect it. Between 2011 and 2012, we observed an overall decrease in the adoption rate, but this was due to an increase in broadband availability rather than a decrease in broadband subscribers. The penetration rate is a more reliable measurement of the changes in subscriptions over time, because it doesn't fluctuate downward when there is an increase in broadband availability (the denominator in the equation). However, the adoption rate is useful in helping us estimate how much lack of broadband access is a factor in low penetration rates, as we will see later in this report.

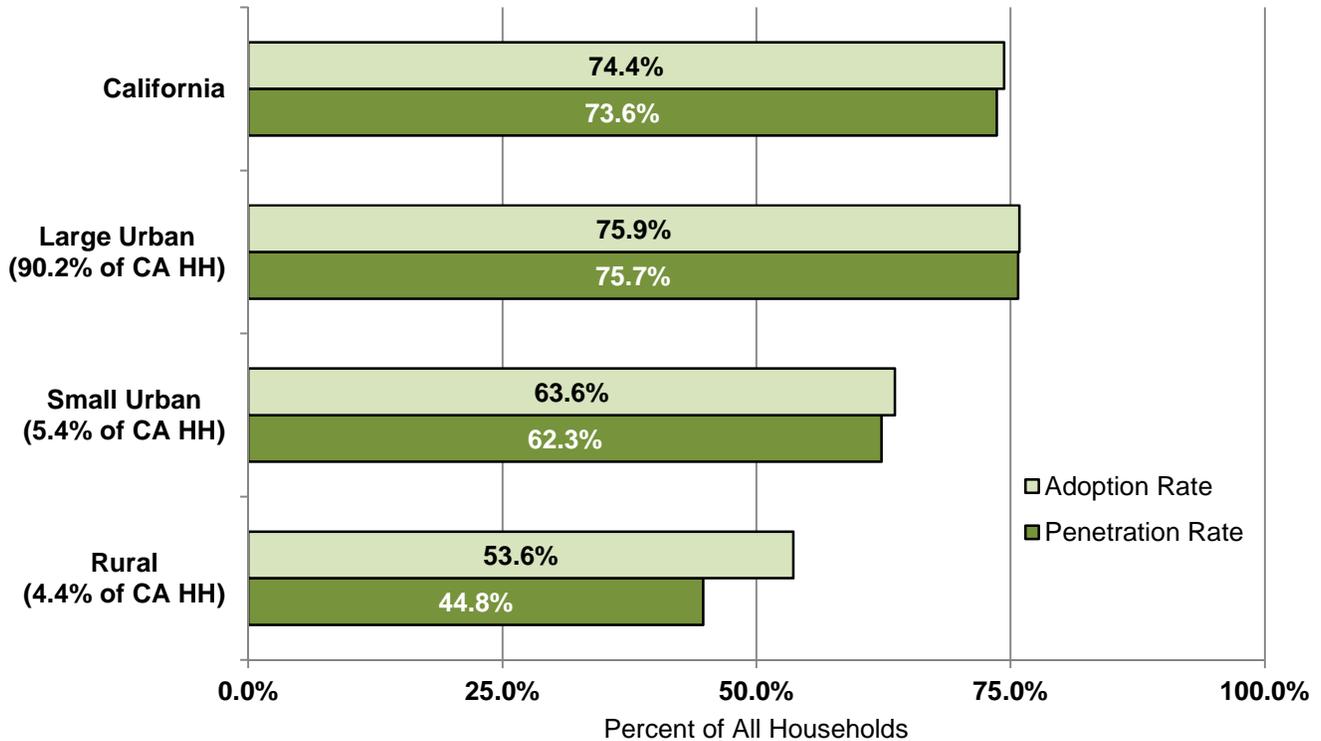

Broadband Penetration: Rural vs. Urban

Figure 1.1 compares adoption and penetration rates among urban (50,000 people or more), small urban (between 2,500 and 49,999 people), and rural (less than 2,500 people) areas to demonstrate the extent to which the lack of broadband penetration is due to lack of infrastructure. The greatest challenge for increasing broadband penetration in California lies in its rural areas, where fewer than half of the households (44.8%) subscribe to broadband service. This is in stark contrast to the large urban areas where more than three fourths (75.7%) of households subscribe to broadband. Looking at this 30.9% gap in rural versus urban broadband penetration, we estimate that about one quarter of it is explained by lack of access to broadband.

In order to estimate how much of the penetration gap was due to lack of infrastructure, we subtracted the rural adoption rate (53.6%) from the large urban adoption rate (75.9%) to estimate the adoption rate gap. That resulted in 22.3%. We then subtracted the adoption rate gap from the penetration rate gap (30.9% - 22.3% = 8.6%) and divided that by the penetration rate gap, which resulted in 27.8%, or just over one quarter. The remaining 72.2% percent of the rural-urban penetration gap is explained by a combination of other factors such as price/affordability, reliability, lack of alternatives, over-statement of provider coverage, and level of English language fluency, as suggested by other studies².

Broadband Penetration and Adoption Rates by County

Figure 3.1 summarizes broadband penetration rates and adoption rates for each of California’s counties as of June 30, 2012 and further highlights the rural-urban penetration gap. Eight counties, all with large or small urban centers, had penetration rates greater than 80%. In contrast, seven counties, predominantly or entirely rural, had penetration rates below 50%. The counties with greater than 80% were the Bay Area counties of Contra Costa, Marin, San Mateo, Santa Clara, the southland counties of Orange, San Diego, and Ventura, and the very small county of Alpine which has a large number of second homes that have broadband connections in vacation homes. The counties with low penetration rates were Colusa, Glenn, Mendocino, Siskiyou, Tehama, Tuolumne, and Tulare.

Data for Del Norte, Kings, Modoc, Mono, and Trinity counties were withheld to protect confidentiality of the individual service providers, either because one service provider had over 80% of the area’s subscriptions, or there were fewer than three service providers in the area, in accordance with guidelines developed by the United States Department of Commerce.

FIGURE 1.2: Penetration and Adoption Rates by County, June 2012

County	Households ¹	Households with Fixed Broadband Available	Number of Providers	Residential Fixed Broadband Subscriptions	Adoption Rate	Penetration Rate

FIGURE 1.2: Penetration and Adoption Rates by County, June 2012

County	Households ¹	Households with Fixed Broadband Available	Number of Providers	Residential Fixed Broadband Subscriptions	Adoption Rate	Penetration Rate
<i>Sonoma</i>	186,771	184,758	9	137,067	74.2%	73.4%
<i>Stanislaus</i>	165,477	165,430	6	103,159	62.4%	62.3%
<i>Sutter</i>	31,524	31,524	4	19,872	63.0%	63.0%
<i>Tehama</i>	23,926	23,776	7	10,778	45.3%	45.0%
<i>Trinity</i>	6,097	3,493	2	See note below		
<i>Tulare</i>	132,171	131,292	7	59,877	45.6%	45.3%
<i>Tuolumne</i>	22,184	17,907	5	11,068	61.8%	49.9%
<i>Ventura</i>	268,392	266,787	8	216,253	81.1%	80.6%
<i>Yolo</i>	70,306	70,270	8	48,371	68.8%	68.8%
<i>Yuba</i>	24,436	24,402	4	14,041	57.5%	57.5%

Note: Results are not displayed when, in accordance with US Department of Commerce guidelines, doing so would risk disclosure of confidential data. Broadband provider confidentiality is protected for any county where fewer than 3 providers submitted data or if any one provider had more than 80% of reported connections in that county.

¹CPUC estimate based on data from the California Department of Finance.

²Adoption rate exceeds 100% because connections include vacation homes, which are not included in household counts.

Gaps in Urban Broadband Penetration

In addition to the large rural-urban penetration gap, we also observed a penetration gap among census tracts within large urban areas. The image below shows census tracts with low penetration rates highlighted in red and orange. Notice that some census tracts in Los Angeles and Sacramento are shaded red and dark orange, where penetration is below 50%. We know from the broadband availability data that the low penetration rates in these tracts is less a function of broadband access than it is of other factors such as affordability and digital literacy, because broadband availability in these areas is high (>90%), but subscription rates are below the average for the area as a whole.

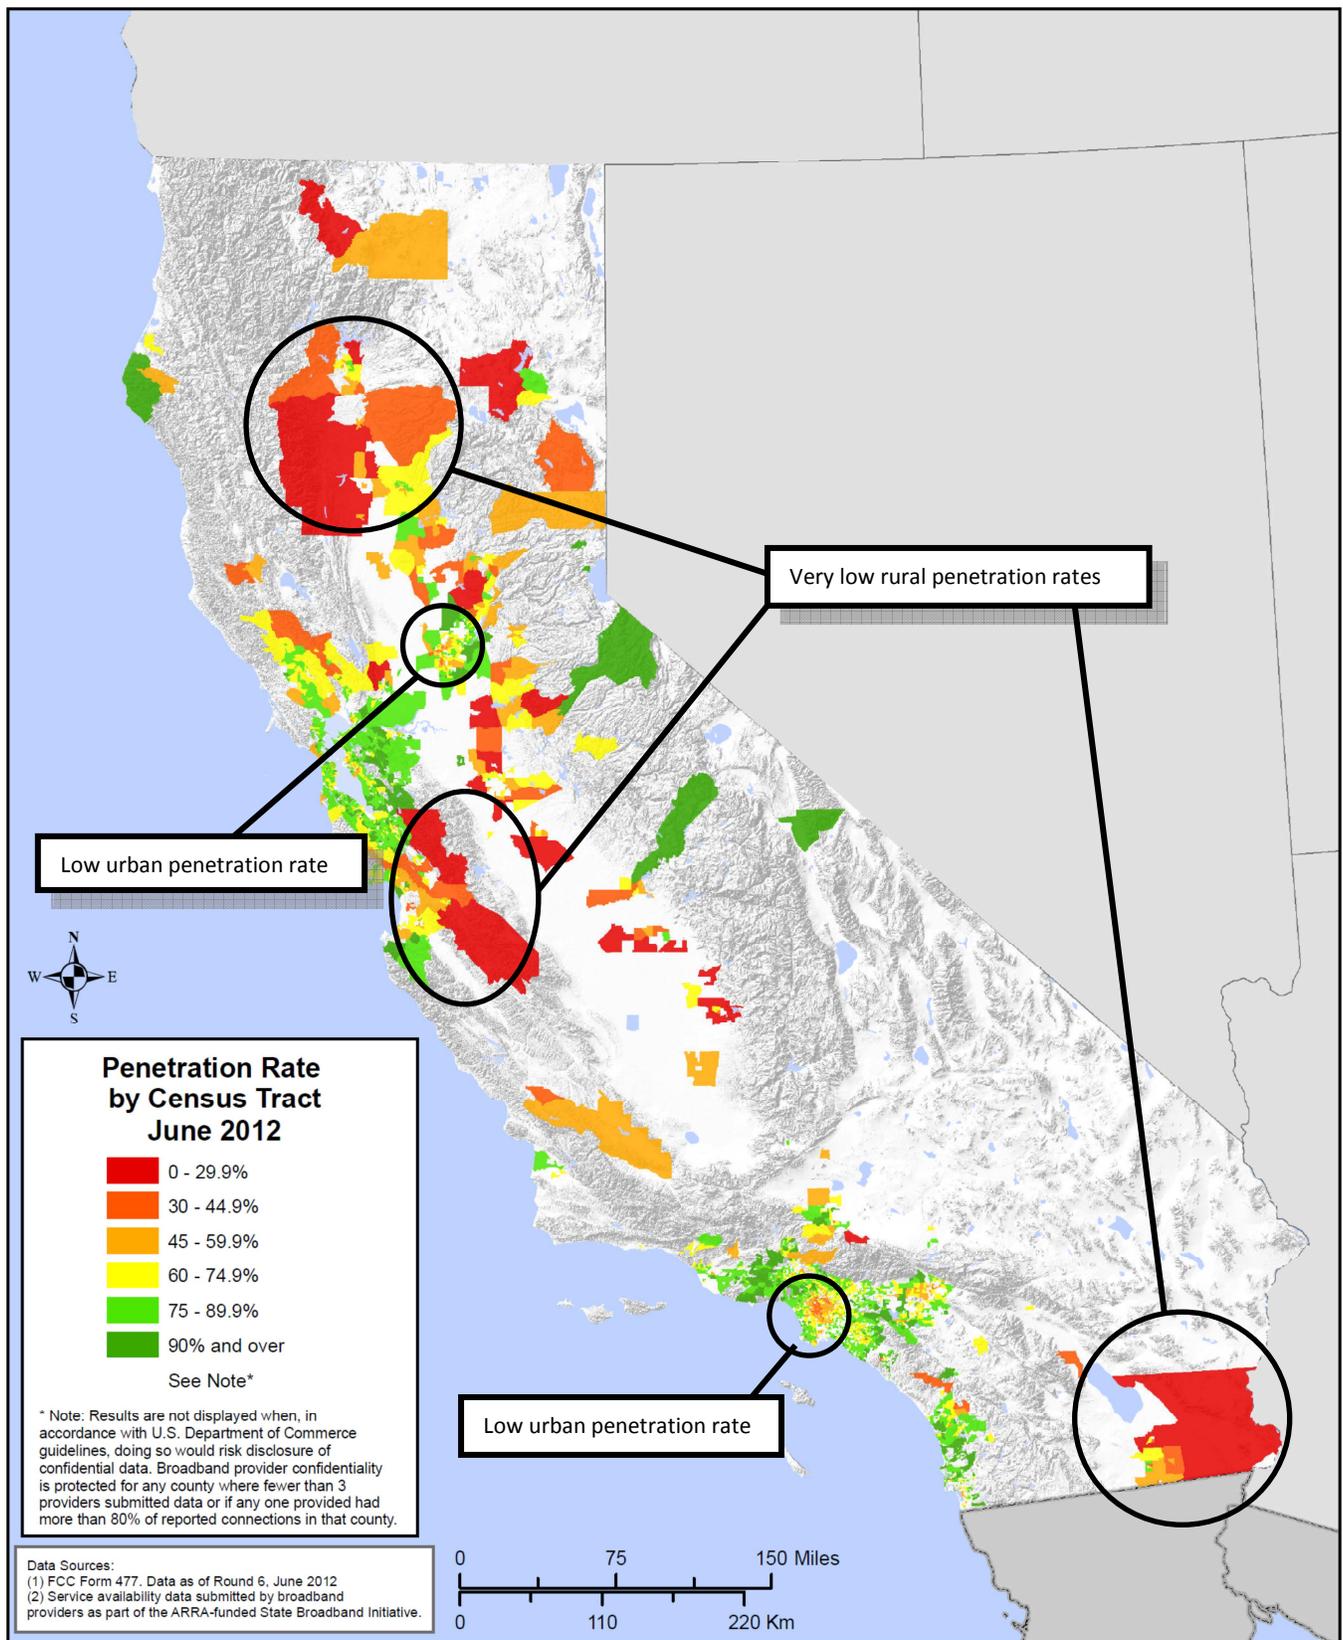

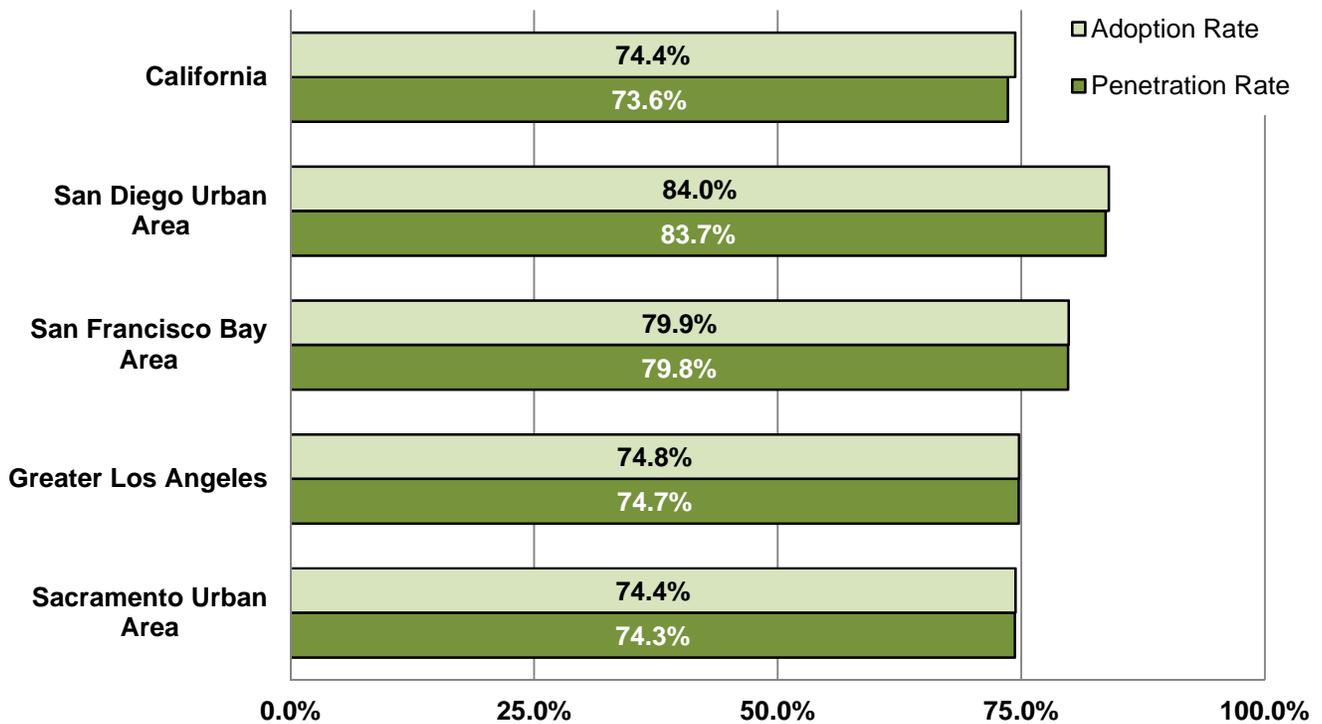

Figure 1.4, below, shows penetration rates for California urban areas with more than one million people. Los Angeles and Sacramento have some census tracts with very low penetration rates, and this is reflected in the lower average for those two urban areas compared to San Francisco and San Diego.

The San Diego Urban Area includes only the City of San Diego; the San Francisco Bay Area includes San Francisco, Oakland, San Jose, Vallejo, Concord, and Livermore; Greater Los Angeles includes Los Angeles, Long Beach, Anaheim, Mission Viejo, Lake Forest, San Clemente, Riverside, San Bernardino, Simi Valley, and Thousand Oaks; the Sacramento Urban Area includes only the City of Sacramento.

FIGURE 1.4: Broadband Penetration Rates for California’s Major Urban Areas

Source: FCC Form 477

Figures 1.5 through 1.8 are maps of each of these major urban areas. Notice the disparity in broadband penetration rates between neighborhoods. In Greater Los Angeles, for example, South Los Angeles has census tracts with penetration rates below 45 percent, while many suburban neighborhoods like those in Thousand Oaks, Simi Valley, and Orange County show penetration rates greater than 90 percent.

FIGURE 1.5: Broadband Penetration Rates: Greater Los Angeles

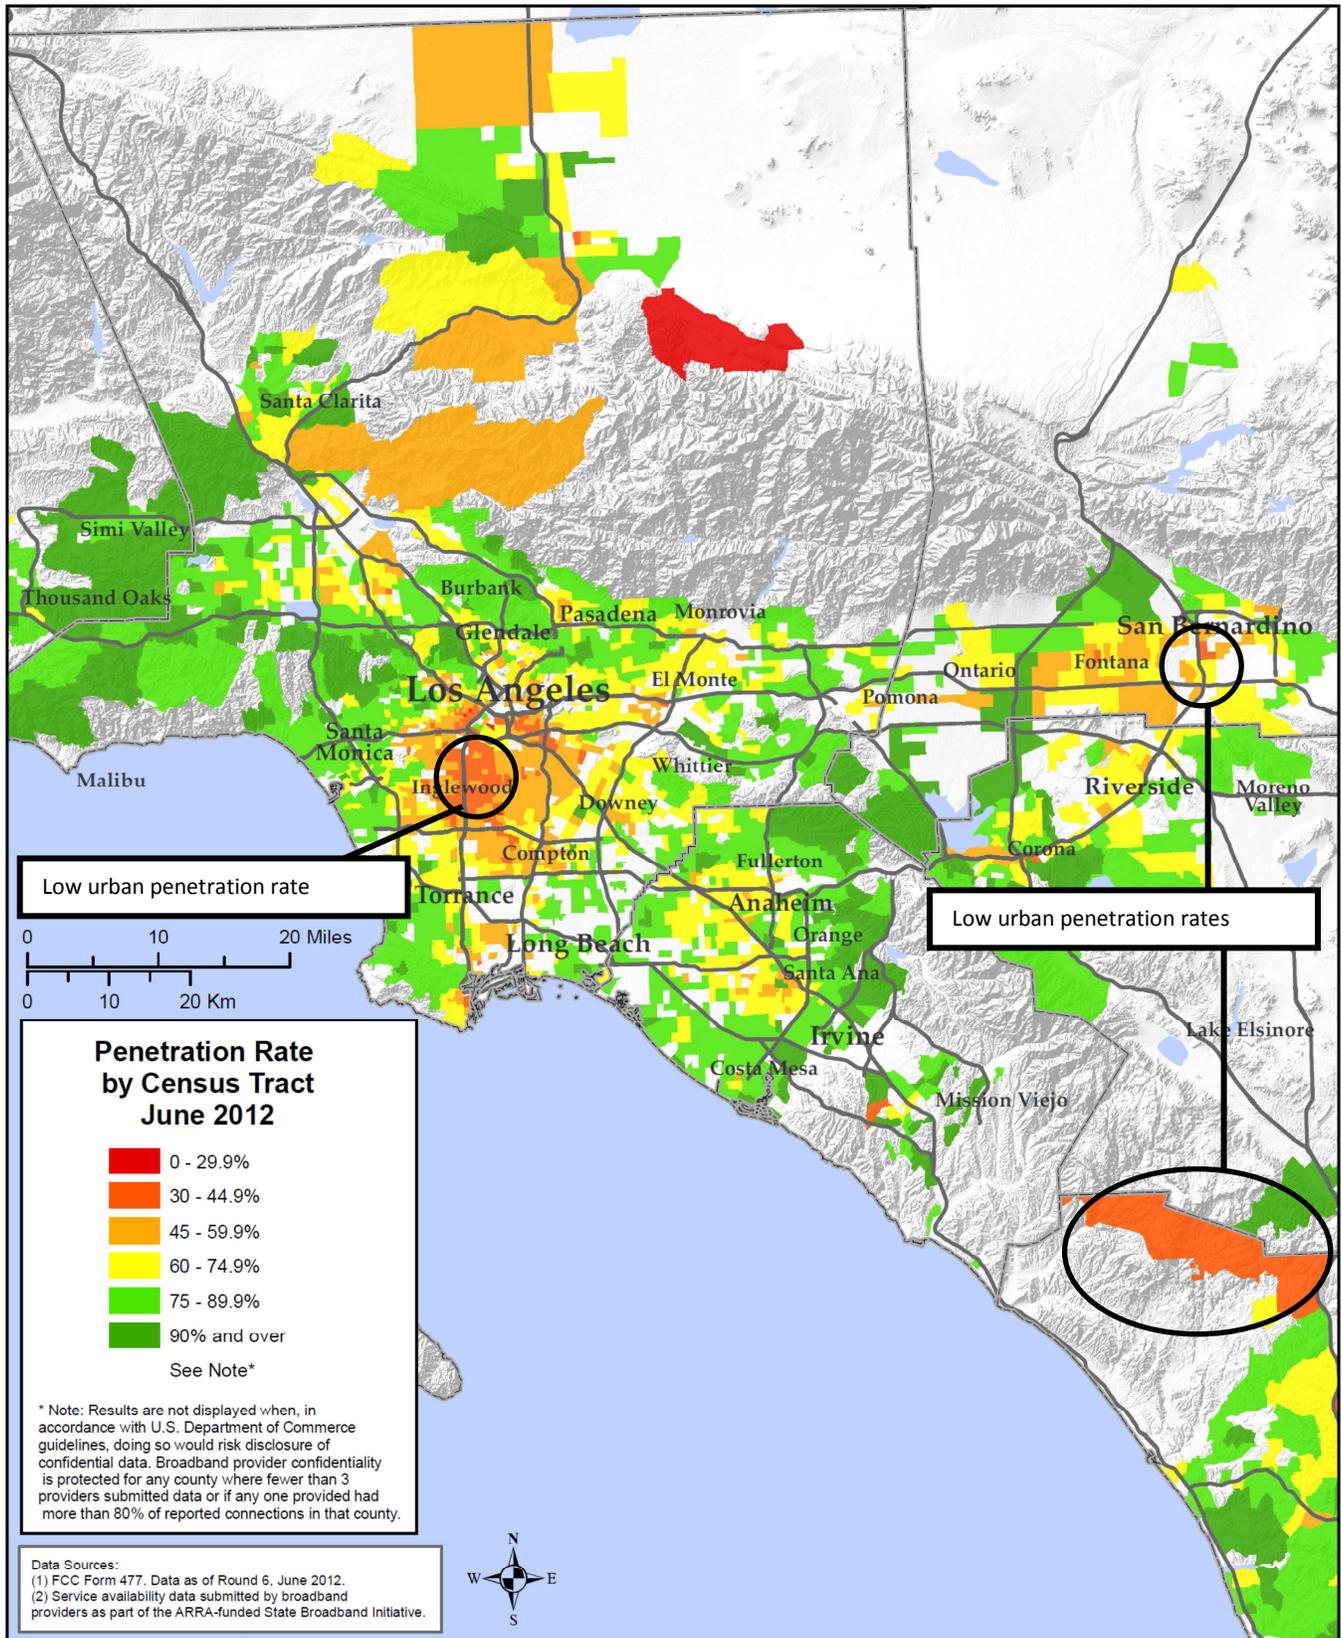

FIGURE 1.6: Broadband Penetration Rates: Sacramento Urban Area

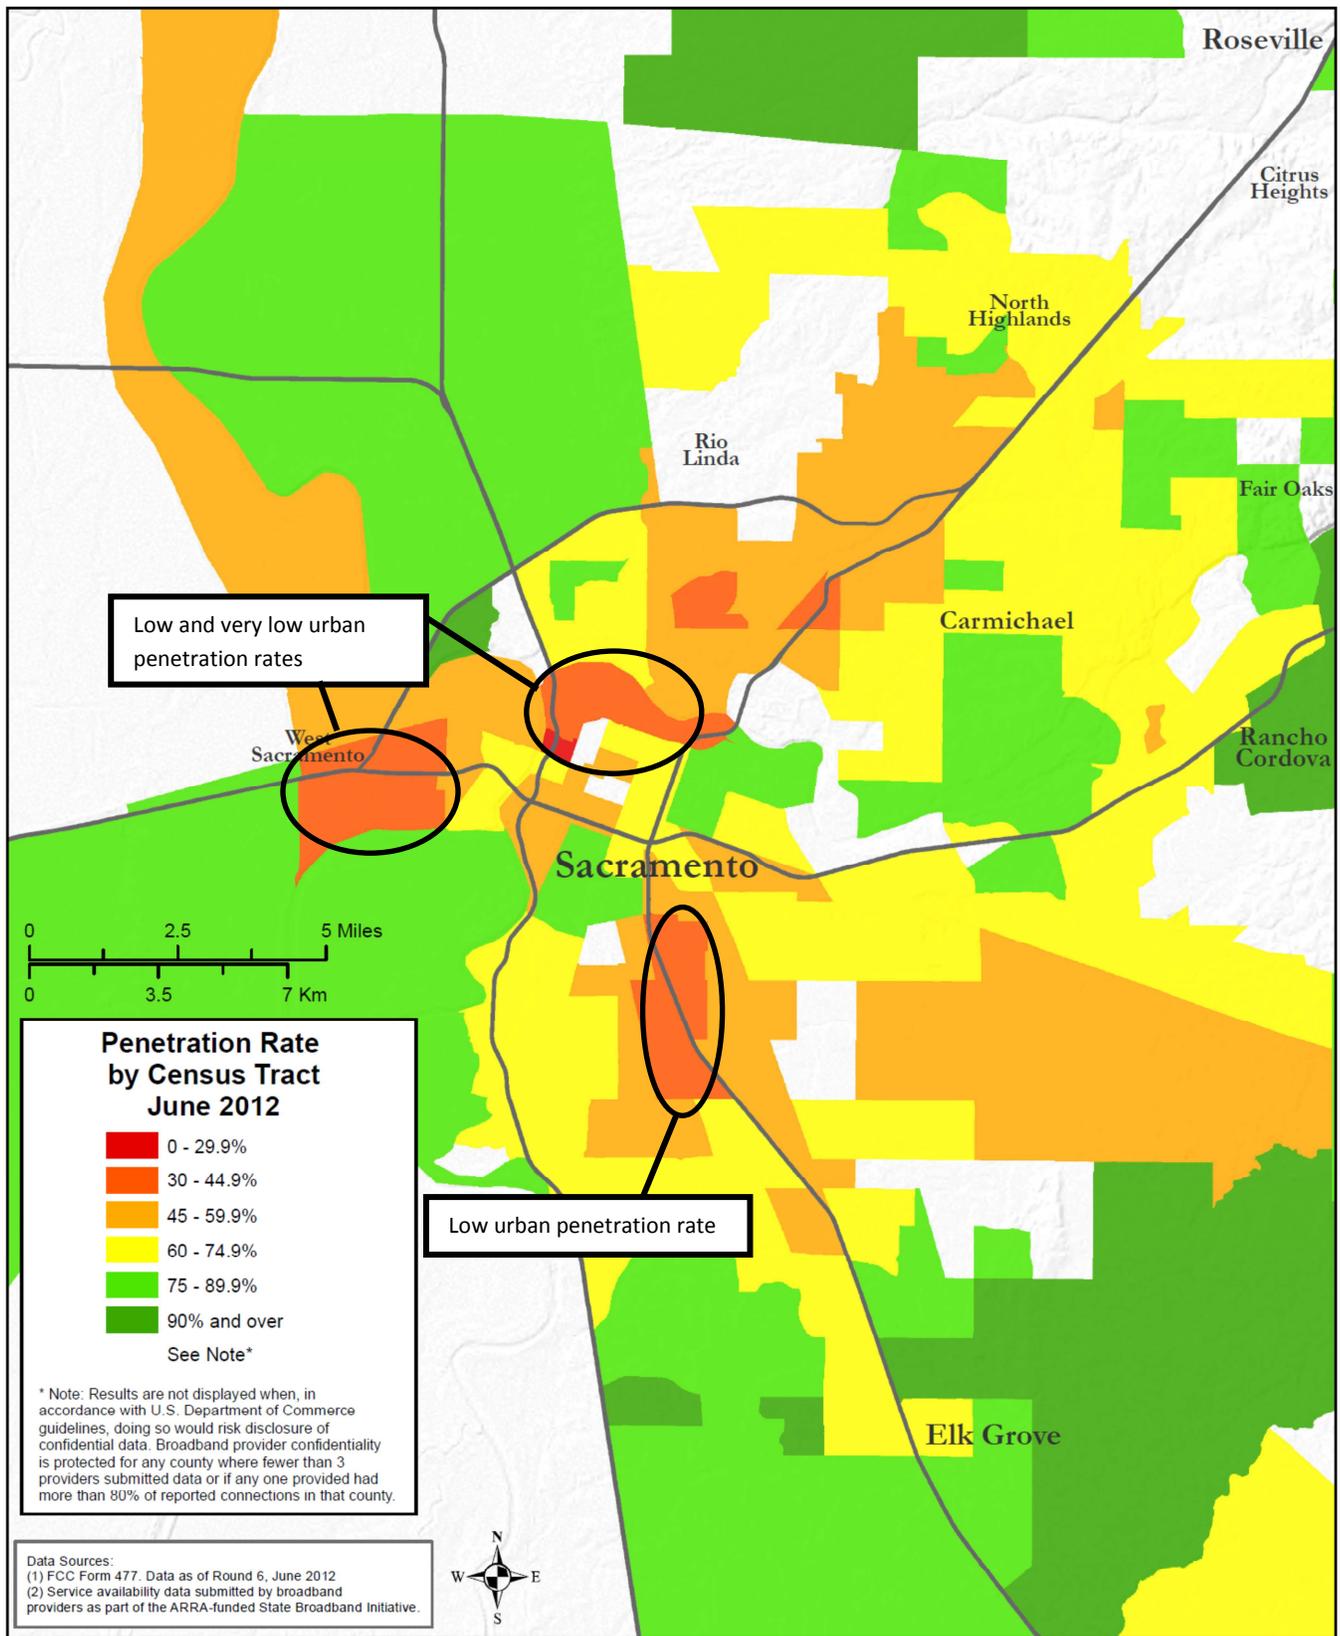

FIGURE 1.7: Broadband Penetration Rates: San Francisco Bay Area

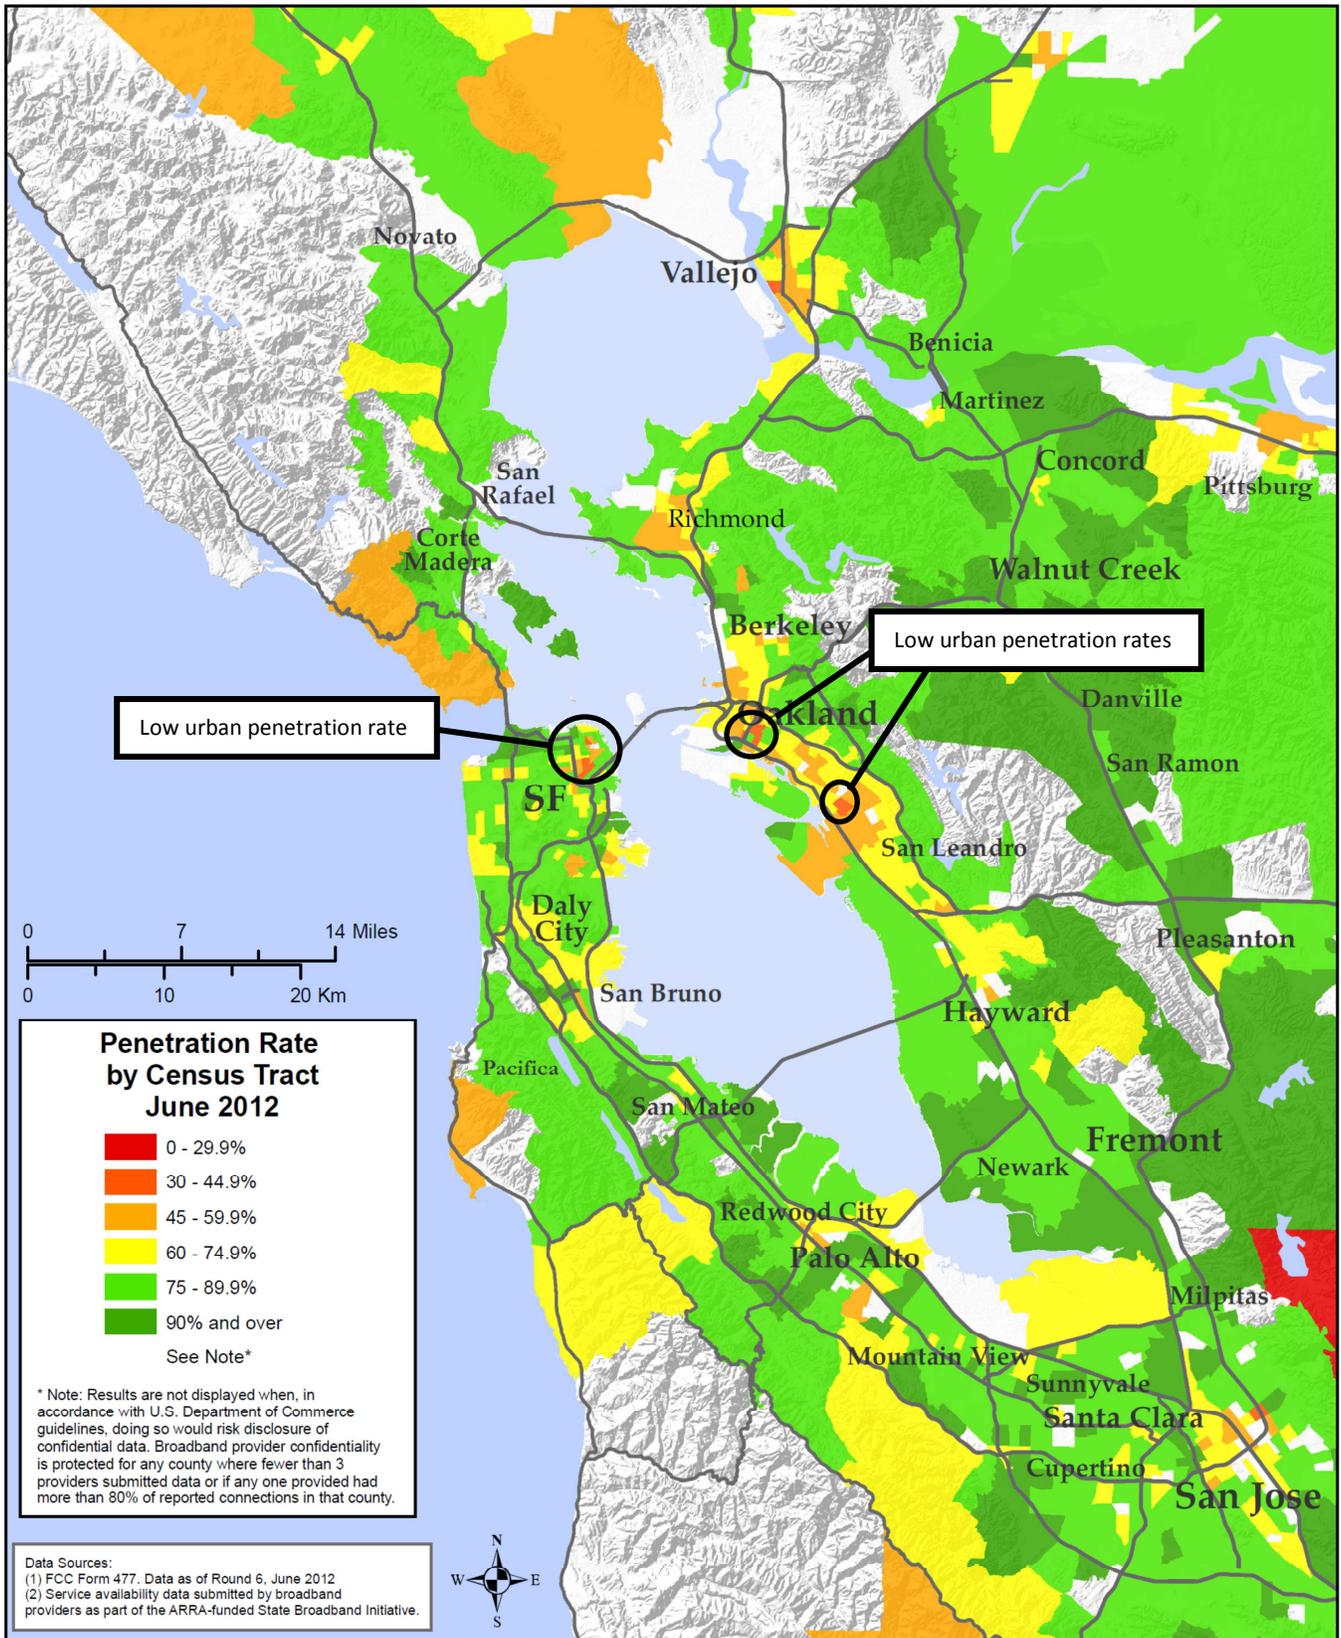

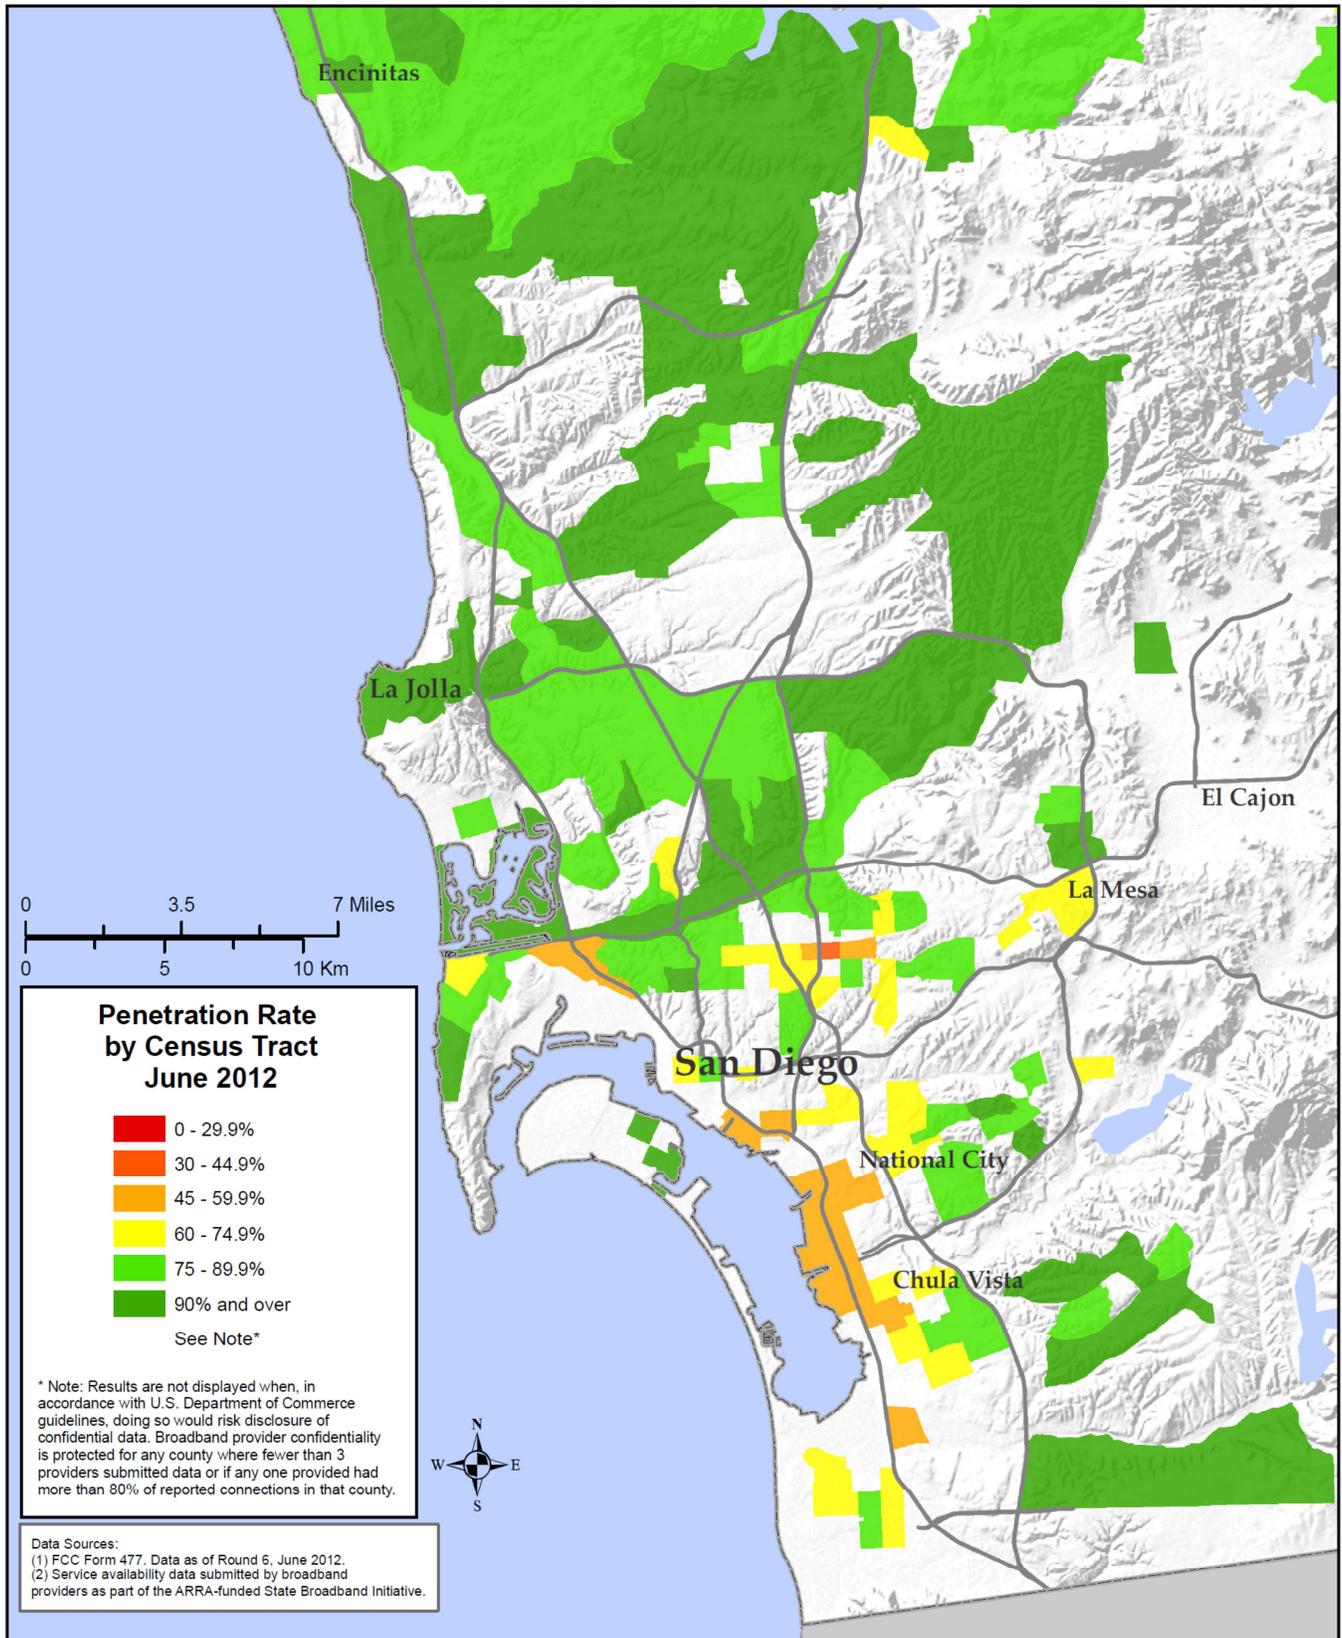

FIGURE 1.8: Broadband Penetration Rates: San Diego Urban Area

Penetration Rate Change

Between 2011 and 2012, the overall broadband penetration rate increased by 4%. The following Figure 3.2 summarizes changes in broadband penetration rates from 2011 to 2012 for the state as well as each county. Changes in penetration rates are shown only where confidentiality criteria were met for both reporting periods. We found only one county, Lassen, where the penetration rate dropped between 2011 and 2012, and this was due to a decrease in subscriptions by one provider, which resulted in an overall decrease of 808 subscriptions.

FIGURE 1.8: Changes in Penetration and Adoption Rates by County

Note: Results are not displayed when, in accordance with US Department of Commerce guidelines, doing so would risk disclosure of confidential data. Broadband provider confidentiality is protected for any county where fewer than three providers submitted data or if any one provider had more than 80% of reported connections in that county.

3 Broadband Subscriptions by Connection Speed

Not only did broadband penetration increase overall from 2011 to 2012, we also observed more broadband subscribers upgrading to faster speeds. Figure 2.1, below, reports the total number of fixed broadband connections by speed for both June 2011 and June 2012. While there was more than a 6% increase in broadband subscriptions between 2011 (9,594,236) and 2012 (10,176,967), a larger percentage of those subscriptions in 2012 were for higher download speeds, and a smaller percentage of residential connections had download speeds of less than 3 megabits per second in 2012 (20.8 percent), than in 2011 (25.5 percent).

FIGURE 2.1: Distribution of Reportable Fixed Connections by Speed Tier in California

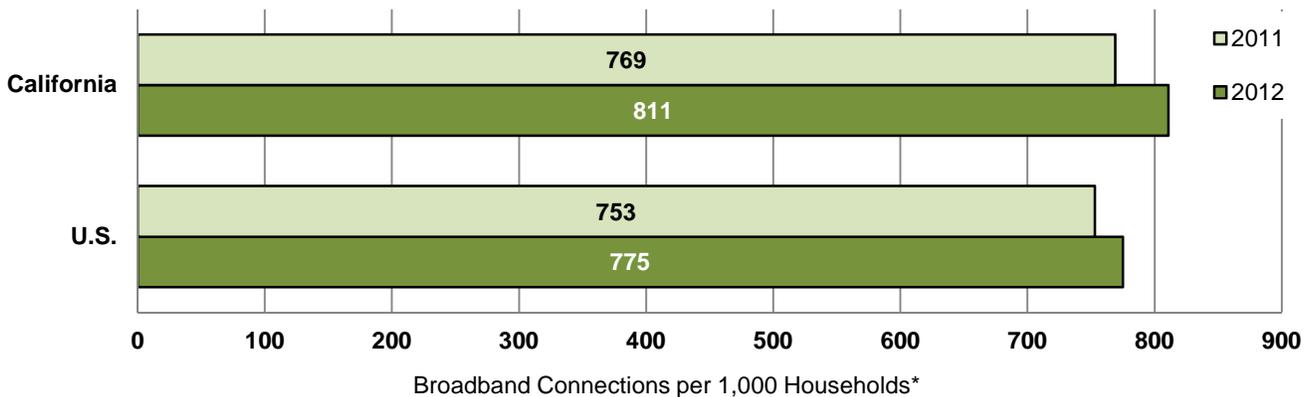

Speed Tier		2011				2012			
		All Connections		Residential Connections		All Connections		Residential Connections	
Download Speed	< 3 Mbps	2,605,837	27.2%	2,233,666	25.5%	2,274,480	22.3%	1,938,277	20.8%

Comparing Broadband Penetration Rates in California and the US

Between 2011 and 2012, broadband penetration in California was higher than in the US, and it grew faster than in the US overall. As shown below, California had 3.6% more broadband subscribers per 1,000 households than the US in 2012. The United States estimate comes from the FCC’s “Internet Access Services: Status as of June 30, 2012” report, and the California number comes from broadband availability data and the US Census Bureau’s American Community Survey one-year estimates for 2011 and 2012.

FIGURE 2.1: Broadband Connections per 1,000 Households, California and US

Source: FCC Form 477, FCC’s “Internet Access Services: Status as of June 30, 2012” report, and US Census Bureau American Community Survey 1-year household estimates in 2011 and 2012.

Comparing California to Other States

Despite the California's favorable penetration rate compared to the US overall, California ranks only 14th in terms of broadband availability by population. However, it is important to note that California has some of the most difficult and varied terrain, and yet it has more broadband availability than the top five states combined. The table below comes from the FCC's National Broadband Map³ and ranks each state/district in terms of the percent of population with access to broadband speeds per the federal definition of "broadband"⁴. The data is as of June 30, 2013.

FIGURE 2.3: Top 20 States/Districts Based On Percent Population With Broadband Access

Rank	State/District	% Population with access to > 768 Kb/s down and 200 Kb/s up	Margin of Error	2013 Population
1	District Of Columbia	100.00%	0.00%	646,449
2	New Jersey	100.00%	0.01%	8,899,339
3	Delaware	100.00%	0.01%	925,749
4	Rhode Island	100.00%	0.02%	1,051,511
5	Florida	100.00%	0.03%	19,552,860
6	Illinois	100.00%	0.04%	12,882,135
7	Connecticut	100.00%	0.04%	3,596,080
8	Kansas	100.00%	0.03%	2,893,957
9	Maryland	99.94%	0.06%	5,928,814
10	Massachusetts	99.91%	0.08%	6,692,824
11	Nevada	99.91%	0.08%	2,790,136
12	Indiana	99.90%	0.10%	6,570,902
13	Iowa	99.90%	0.10%	3,090,416
14	California	99.88%	0.10%	38,332,521
15	Texas	99.87%	0.12%	26,448,193
16	Mississippi	99.85%	0.15%	2,991,207
17	New York	99.83%	0.16%	19,651,127
18	Utah	99.82%	0.14%	2,900,872
19	Michigan	99.80%	0.18%	9,895,622
20	North Dakota	99.80%	0.18%	723,393

4 Conclusion

Despite clear progress in closing the Digital Divide, and an increase in broadband penetration from 2011 to 2012, a large disparity still exists between rural and urban counties. There was a significant gap (30.9%) in rural

³ The complete table may be found at <http://www.broadbandmap.gov/rank/all/state/percent-population/within-nation/speed-download-greater-than-0.768mbps-upload-greater-than-0.200mbps/ascending>

⁴ The percentage of households having availability at the federal broadband definition level is much greater than the percentage of households having availability at the minimum California standard of 6 mbps downstream and 1.5 mbps upstream. The latter is presented in the CPUC's California Advanced Services 2013 report, <http://www.cpuc.ca.gov/PUC/Telco/generalInfo/CPUC+Reports+and+Presentations.htm>

penetration compared to that of large urban areas. Less than half of rural households were connected to broadband in 2012. About a quarter of that difference was due to lack of broadband access. Eight urban counties had penetration rates greater than 80%, whereas seven rural counties had penetration rates below 50%.

In addition to the large urban-rural discrepancy, we saw low penetration rates (below 50%) in some urban census tracts. Lower income sections of Los Angeles and Sacramento stood out compared to those in San Francisco and San Diego, which had higher overall penetration rates.

Compared to the U.S. overall, California had more connected households on a per household basis, but compared to other states, California ranked 14th in terms of broadband availability. But California's total connected population exceeded the combined total of the top 5 states.

5 Technical Notes

Overview of Data Sources

This report draws from three primary data sources: the June 30, 2012 edition of the FCC Form 477, June 30, 2012 geographic Internet availability data collected by the California Public Utilities Commission and a compilation of publicly available demographic information from the United States Census Bureau. Each of these data sources is described in detail in this section.

FCC Form 477 (June 30, 2012)

The purpose of Form 477 is to “gather standardized information about subscribership to Internet access services in the fifty states”.⁵ Twice yearly, broadband Internet providers of various technology types report the number of subscribers they serve, both commercial and residential, at the census tract level. The FCC uses “reportable connection” to describe an address where Internet service is available for use by occupants of a household. For this report, we equate “subscription” with a reportable connection. The FCC's Form 477 data also shows subscriptions by broadband connection speeds. This section summarizes some of the statistics on broadband subscriptions in California. This information can be used to determine the broadband penetration rate – the ratio of residential broadband subscriptions to households in a census tract. It also can be used in conjunction with broadband availability data to derive a broadband adoption rate-- the ratio of residential broadband subscriptions to households which have geographic access to broadband services in a census tract.

Subscriber data submitted to the FCC by broadband service providers are confidential, so anything we report in this paper must preserve that confidentiality. More information about the FCC Form 477, including collection methods and reporting dates, can be found by visiting their website: <http://transition.fcc.gov/form477/>

Broadband Availability Data (June 30, 2012)

The California Public Utilities Commission (CPUC) collects data regarding the *availability* of broadband services, pursuant to the State Broadband Initiative administered by the National Telecommunications and Information Administration and funded by the American Recovery and Reinvestment Act. The CPUC collects this geographic coverage data twice yearly, using the same time intervals as the FCC's Form 477, allowing for the two datasets to be compared directly. Rules for what constitutes "availability" are described in the Notice of Funds Availability for the State Broadband Initiative program⁶

The CPUC has contracted with the Geographical Information Center and the Center for Economic Development at California State University, Chico to assist with data compilation, processing, and interpretation.

For more information about the State Broadband Mapping Program, visit the CPUC's website at:

<http://www.cpuc.ca.gov/PUC/Telco/Information+for+providing+service/Broadband+Mapping/index.htm>

To examine the most current edition of availability data without the need for specialized software, visit the California Interactive Broadband Map: <http://www.broadbandmap.ca.gov/>

Household Data

The United States Census Bureau is the federal agency responsible for collecting demographic and socioeconomic data for public use. The decennial census fully surveys the population to obtain information about population, households, and race, while more in-depth economic and social statistics are collected by the American Community Survey, using smaller sample rates.

In this report, we use the CPUCs household estimates for June 2011 and June 2012 based on the California Department of Finance estimates for January 2011, 2012 and 2013. For more information about the US Census and projections made by the California Department of Finance, visit the Demographic Research Unit's page at: <http://www.dof.ca.gov/research/demographic/overview/>

To compare California adoption with the US adoption, this report uses one year American Community Survey estimates for the California and US.

FCC Form 477 Data

Detailed information regarding FCC Form 477 data can be found in the "Technical Notes" section of "Internet Access Services as of 6/30/12", published by the Wireline Competition Bureau of the FCC's Industry Analysis and Technology Division.

To view the report, visit the FCC's website: <http://www.fcc.gov/reports/internet-access-services-63012>

To learn more about how Form 477 is collected, visit the FCC's *Form 477 Resources for Filers* page: <http://transition.fcc.gov/form477/>

Graphical Example of Adoption Rate vs. Penetration Rate

A theoretical internet service provider claims to have service available in the circled area below. The square area shows the border of the census tract where the service is offered. There are ten households in the census tract, but only eight of those households have access to broadband. Based on this, we calculate broadband availability in this example to be 8 households.

Assume that the internet service provider in this example has only 5 households in its service area subscribing to it service. The adoption rate would be 5 households subscribing to service divided by a total of 8 households where service is available (within the circle), or 62.5%. The penetration rate is slightly lower. We calculate penetration rate to be the number of households subscribing to internet service divided by the total households, which in this case is ten. Thus, the penetration rate is 50%.

Example of Broadband Metrics

Adoption Rate: $5/8 = 62.5\%$

Penetration Rate: $5/10 = 50.0\%$
