# Executive Summary

---

The reliability information contained in this report is for calendar year 2018, as required by California Public Utilities Commission (CPUC, or Commission) Decision 16-01-008. The data includes all outages (planned and unplanned) for distribution customers including and excluding Major Event Days (MED). SCE only excludes MEDs from the data where noted, and no other exclusions or exceptions were applied.

Unplanned outages and their calculated reliability indices are captured and calculated from our Outage Database and Reliability Metrics (ODRM) system.

Beginning in October 2015, SCE began collecting SmartMeter data for calculating and reporting planned outage reliability indices. SCE provides planned outage reliability indices for this report starting with the first full year available. The first full year for which this information was available was 2016.

The following content contained in this report is based on reliability indicators, definitions and calculations as defined below.

**Major Event Day:** A day in which the daily system SAIDI exceeds a threshold value. For purposes of calculating daily system SAIDI, any interruption that spans multiple calendar days is accrued to the day on which the interruption began. Statistically, days having a daily system SAIDI greater than a threshold value are days on which the energy delivery system experienced stresses beyond that normally expected (such as severe weather). Events are excluded based on the “2.5 beta method.” Per IEEE Standard 1366, days are excluded from a given year’s metric if their SAIDI exceeds 2.5 times the standard deviation of the natural logarithm of daily SAIDI over the previous five-year period.

**ODRM:** Outage Database and Reliability Metrics

**OMS:** Outage Management System

**Sustained Interruption:** Outage lasting longer than 5 minutes as defined in IEEE Std. 1366-2003

**Momentary Interruption:** Outage lasting 5 minutes or less as defined in IEEE Std. 1366-2003

**SAIDI:** The System Average Interruption Duration Index is the amount of time on average a customer was without power in a year due to sustained interruptions (measured in minutes per customer)

$$\text{SAIDI} = \frac{\text{sum of all "sustained" customer interruption durations}}{\text{total number of customers served}}$$

**SAIFI:** The System Average Interruption Frequency Index is the number of times an average customer was without power in a year due to service interruptions lasting more than 5 minutes (measured in interruptions per customer)

$$\text{SAIFI} = \frac{\text{sum of total quantity of "sustained" customer interruptions}}{\text{total number of customers served}}$$

**MAIFI:** The Momentary Average Interruption Frequency Index is the number of times an average customer was without power in a year due to service interruptions lasting 5 minutes or less (measured in interruptions per customer)

$$\text{MAIFI} = \frac{\text{sum of total quantity of "momentary" customer interruptions}}{\text{total number of customers served}}$$

**Tmed:** The calculated threshold value used to determine a Major Event Day. SCE's TMED value is calculated at the beginning of each year using SCE's daily SAIDI values for the prior 5 years. SCE's TMED value for 2018 was 1.76 min.

In years 2006 - 2010, SAIDI, SAIFI, and MAIFI were calculated per IEEE 1366 with the exception of using five years of historical data in applying the "2.5 beta method" to determine excludable days. Per IEEE 1366, days are excluded from a given year's metric if their SAIDI exceeds 2.5 times the standard deviation of the natural logarithm of daily SAIDI over the previous five-year period. However, complete ODRM data did not exist prior to 2006. Therefore, excludable days for years 2006 and 2007 were both determined based on daily SAIDI data in year 2006.

Excludable days for 2008 were determined based on daily SAIDI data in years 2006 and 2007. Excludable days for 2009 were determined based on daily SAIDI data in years 2006, 2007, and 2008. Excludable days for 2010 were determined based on daily SAIDI data in years 2006, 2007, 2008, and 2009. This interim approach is consistent with IEEE 1366.

## **SCE 2018 Performance Summary**

The below table captures SCE's 2018 performance for repair outages including and excluding MED. The table also consists of a 10-year average performance for repair outages including and excluding MED for comparison. In 2018, SCE saw an improvement in reliability, excluding MED. SCE continues to look for ways to improve our reliability performance, with a particular focus on reducing restoration times by improving processes for operations response, lessening customer impact through real-time outage diagnostics, and enhancing infrastructure by automating Remote Re-closer Settings.

YEAR	Total System Indices (All Interruptions Included)				Total System Indices (Major Event Days Excluded)			
	SAIDI	SAIFI	MAIFI	CAIDI	SAIDI	SAIFI	MAIFI	CAIDI
2018	136.82	0.87	1.43	156.61	71.25	0.72	1.27	99.58
10 Year Avg (2009-2018)	132.78	0.98	1.49	134.99	95.62	0.86	1.32	111.29

In addition, due to the increased fire risk from dry conditions and high winds, SCE has implemented proactive de-energization for our high-risk wildfire areas. This is known as Public Safety Power Shutoff (PSPS). SCE implemented proactive de-energization later in the year; therefore, a full impact will not be seen in 2018. Impacts to our system totaled 0.034 SAIDI min. and 0.000 SAIFI. Most of these events occurred on days that already met the Major Event Day exclusion criteria, leaving 0.004 SAIDI min and 0.000 SAIFI remaining in our non-excludable data. Total System Indices excluding MED, Planned, and PSPS are seen in the table below.

YEAR	MED, Planned, and Proactive De-energization Excluded			
	SAIDI	SAIFI	MAIFI	CAIDI
2018	71.21	0.72	1.27	99.58

In 2018, SCE experienced multiple fires and storm related events across its territory, some of which impacted reliability enough to result in MEDs. In total, SCE had 13 MEDs. Please refer below to the summary table of Major Event Days.

## SECTION 1 – SYSTEM INDICES FOR THE LAST 10 YEARS

### a. System Indices Tables

Table 1 below contains the required SAIDI, SAIFI, MAIFI<sup>1</sup> and CAIDI indices for 2009-2018 including and excluding Major Event Day (MED) for the SCE System unplanned Outages. All calculations contained in the table are based on the IEEE 1366 method for Major Event Day (MED). Reliability indices are for unplanned outages only.

**SECTION 3: SYSTEM AND DISTRICT INDICES BASED ON IEEE 1366 FOR THE PAST 10 YEARS INCLUDING PLANNED AND UNPLANNED OUTAGES AND INCLUDING AND EXCLUDING MED**

Table 5 below contains the required SAIDI, SAIFI, MAIFI<sup>5</sup> and CAIDI indices for 2009-2018 including and excluding Major Event Day (MED) for the SCE System, Planned and Unplanned outages combined. All calculations contained in the table are based on the IEEE 1366 method for Major Event Day (MED). Planned outages are not excluded on Major Event Days.

## SECTION 4 – SERVICE TERRITORY MAP

The following is the SCE Service Territory with Power Delivery Regions and Districts Map. The map contains both SCE district boundaries and county boundaries. SCE has 8 regions and 35 districts.

## **SECTION 5 – TOP 1% OF WORST PERFORMING CIRCUITS (WPC) EXCLUDING MAJOR EVENT DAY (MED)**

SCE's Worst Performing Circuits (WPC) projects take two years from circuit review to construction completion. A worst performing circuit rehabilitation identifies enhancements to improve the overall circuit reliability, as well as appropriate replacement of our riskiest assets. These circuit enhancements include equipment such as additional switches for isolation, installation of automation, automatic reclosers, branch line fuses, and fault indicators wherever judged to be cost-effective. A project may not be scoped if we have already planned other work that will enhance reliability.

SCE's selection of its WPC's begins with three years of historical data excluding MED and planned outages. Recent years are weighted higher by factors of 61%, 28% and 11%, respectively. The sum of SAIDI for the weighted three years are then ranked in descending order for the SAIDI index. The same methodology is applied to SAIFI for the SAIFI index. The top 1% of circuits SAIDI and top 1% of circuits SAIFI are then listed and reviewed for improvements (See Tables 7 and 8). The method produces 46 circuits based on SAIDI and 46 circuit based on SAIFI.

Please see below Table 7 and Table 8 that capture the top 1% WPC. Table 7 contains the Top 1% WPC using the SAIDI metric and Table 8 contains the Top 1% WPC using the SAIFI metric. The tables provide the (1) circuit name, (2) district, (3) customer count, (4) substation name, (5) circuit miles, (6) %UG, (7) %OH, (8) number of mainline outages resulting in the operation of a circuit breaker or automatic recloser, (9) System Level reliability metric, and (10) Circuit Level reliability metric.

---

<sup>7</sup> The numerical value (6) indicates any circuit where a customer has experienced greater or equal to 6 outages.

Circuits that have appeared in this report that were in last year's report are marked with an asterisk (\*) per D. 16-01-008 Annual Electric Report.

<sup>1</sup> Includes Sustain and Momentary outages that affected the Circuit Breaker.

<sup>2</sup> SAIDI is based on a three-year weighted average.

<sup>3</sup> List is a base case year.

<sup>4</sup> Ckt, SAIDI is based on a three-year weighted factor (Average Customer experience on Circuit).

Circuits that have appeared in this report that were in last year's report are marked with an asterisk (\*) per D. 16-01-008 Annual Electric Report.

<sup>1</sup> Includes Sustain and Momentary outages that affected the Circuit Breaker.

<sup>2</sup> SAIFI is based on a three-year weighted average.

<sup>3</sup> List is a base case year.

<sup>4</sup> Ckt, SAIFI is based on a three-year weighted factor (Average Customer experience on Circuit).

Tables 9 and 10 below identify the circuits that are top 1% WPC (by SAIDI or SAIFI this year) *and* were top 1% circuits by SAIDI or SAIFI on SCE's WPC list in 2016.

The information contained in the tables captures the following information:

- i) An explanation of why it was ranked as a "deficient" circuit, i.e., the value of the metric used to indicate its performance.
- ii) A historical record of the metric.
- iii) An explanation of why it was on the deficiency list again.
- iv) An explanation of what is being done to improve the circuit's future performance and the anticipated timeline for completing those activities (or an explanation why remediation is not being planned).

- v) A quantitative description of the utility's expectation for that circuit's future performance has not been developed, because SCE projects reliability improvements for WCR projects at the system level rather than at the individual circuit level. For additional details, please refer to the discussion in SCE's 2018 General Rate Case Testimony, as shown in Exhibit SCE-02, Volume 08, page 23 ("quantitative benefits").

## SECTION 6 – TOP 10 MAJOR UNPLANNED POWER OUTAGE EVENTS WITHIN A REPORTING YEAR

Table 11 below captures the top 10 major unplanned outage events for 2018 including the cause and location of the outage. Table 12 captures the Number of customers without power in hourly interval for the 2018 Top 10 outages.

## SECTION 7 – SUMMARY LIST OF MED PER IEEE 1366

Table 13 below captures all MED occurring in 2018 per IEEE 1366 definition of MED. The information includes the number of customers without service at periodic intervals, the cause and the location of each Major Event.

**SECTION 9 – THE NUMBER OF CUSTOMER INQUIRIES ON RELIABILITY DATA AND THE NUMBER OF DAYS PER RESPONSE.**

In 2018, SCE received a total of 49 customer inquiries relating to circuit outage history or reliability data. SCE responded to 18% of the inquiries within 7 business days, 53% of the inquiries within 15 business days and 29% in a time frame greater than 15 business days.

## **Appendix-A**

### **Circuit SAIFI**

The number of times the average customer on the circuit experienced an outage lasting more than 5 minutes.

### **Circuit SAIDI**

The amount of time the average customer on the circuit was without power due to outages lasting longer than 5 minutes.

### **Frequency \*Peak Load/#Customers**

The number of outages (AR or CB, sustained +momentary) multiplied by the peak load in the past year all divided by the number of customers.

### **Source Loss**

Circuits that caused other circuits/circuits to experience an outage will have the CI and CMI rolled up into them and ranked. This ranking is based on all distribution outages from 2015 through 2017.

### **Circuits experiencing >=4 cable failures**

Any circuit experiencing greater or equal to 4 sustained cable failures will be flagged in the circuit rankings. This ranking is based on all distribution outages from 2015 through 2017.

### **Circuits experiencing >20 equipment failures**

Any circuit experiencing greater or equal to 20 sustained equipment failures will be flagged in the circuit rankings. This ranking is based on all distribution outages from 2015 through 2017.

### **CEMI6**

Any circuit where a customer has experienced greater or equal to 6 outages in 2017 will be flagged in the circuit rankings.
