# LIST OF ACRONYMS

CAISO	California Independent System Operator	LSE	Load Serving Entity
CAM	Cost Allocation Mechanism	MA	Month Ahead
CCA	Community Choice Aggregator	MIC	Maximum Import Capability
CHP	Combined Heat and Power	MW	Megawatt
CPUC	California Public Utilities Commission	NQC	Net Qualifying Capacity
DER	Distributed Energy Resource	PG&E	Pacific Gas & Electric
DR	Demand Response	PRM	Planning Reserve Margin
DRAM	Demand Response Auction Mechanism	RA	Resource Adequacy
ELCC	Effective Load Carrying Capability	RFO	Request for Offers
ESP	Electric Service Provider	RMR	Reliability Must Run
IOU	Investor Owned Utility	SCE	Southern California Edison
IV	Imperial Valley	SDG&E	San Diego Gas & Electric
LA	Los Angeles	TAC	Transmission Access Charge
LCR	Local Capacity Requirement	YA	Year Ahead

# 1. INTRODUCTION

California Public Utilities Commission (CPUC) Decision 19-02-022 directed Energy Division staff to prepare two reports that would provide “reasonable insight about the current and future state of the Resource Adequacy (RA) market”<sup>1</sup> in order to assist parties as they developed proposals for a central buyer of local RA.

The decision outlines five elements that the reports must address:

1. Total Megawatts (MW) for any/all resources procured – (gas, storage, renewable)/distributed energy resource (DER)) – to meet RA requirements;
2. Development of preferred resources in local and system areas;
3. Information regarding local deficiencies, including the:
  - a. number of load serving entities (LSEs) that are deficient,
  - b. type of LSE (investor owned utility (IOU), community choice aggregator (CCA), electric service provider (ESP)),
  - c. location and amount of deficiencies (in MW),
  - d. number of local RA waiver requests, and anonymized statements from the LSE as to the reason for the deficiency (such as which generators bid into the solicitation, whether the bids included dispatch rights or other terms addressing how local resources bid in the energy market);
4. Information regarding system and flexible capacity deficiencies, including anonymized statements from the LSE as to the reason for the deficiency; and
5. Resources on the Net Qualifying Capacity list that are not shown in RA filings as under contract to an LSE(s).<sup>2</sup>

The initial State of the Market Report, issued September 3, 2019, covered RA filings from the 2019 year ahead filing through the September month ahead filing. This revised report adds data from the remainder of the 2019 month ahead filings and the 2020 year ahead filing.

<sup>2</sup> D.19-02-022 at 31-32.

## 2. RESOURCES PROCURED FOR RA-2019 MONTH AHEAD FILINGS

This section is largely the same as Section 2 of the initial State of the Market Report. The main difference here is that Tables 1 through 5 are expanded to include the months of October, November, and December.

Table 1 provides the MW of each resource type shown by CPUC-jurisdictional LSEs on their month ahead RA plans to meet system RA requirements from January through December 2019.

Resources procured to meet reliability needs by the IOUs and allocated to all customers through the cost allocation mechanism (CAM) are listed under CAM/RMR/LCR resources unless their capacity was later sold to another LSE. Combined heat and power (CHP) and demand response procured through the demand response auction mechanism (DRAM) are allocated in the same manner as CAM resources and are included under CAM.<sup>3</sup>

LSEs also receive a credit for any RA capacity procured by the CAISO as reliability must run (RMR) resources. LSEs serving load in the Southern California Edison (SCE) transmission access charge (TAC) area receive a local capacity requirement (LCR) credit for behind-the-meter resources procured to meet reliability needs in the Los Angeles Basin. These resources are included under RMR/LCR/DRAM PRM with the planning reserve margin adder CPUC credits to DRAM resources. Capacity from utility demand response programs is also allocated to all LSEs by TAC area and shown here as DR Credit. CAM Natural Gas MW were adjusted to account for outages so that resources shown in Table 1 equal the CAM credit shown in Table 3.

As seen below, natural gas generators comprise the majority of RA resources for IOUs, CCAs, and ESPs and can account for approximately two thirds of total RA capacity in some months.

---

<sup>3</sup> A list of 2019 CAM resources is available at <https://www.cpuc.ca.gov/WorkArea/DownloadAsset.aspx?id=6442461336>.

## The State of the Resource Adequacy Market - Revised

In Table 1, dynamically scheduled imports and pseudo-ties (resources located outside of the California Independent System Operator (CAISO) balancing area that bid into the CAISO market as individual resources) are listed under their resource type (nuclear,

## The State of the Resource Adequacy Market - Revised

hydro, solar, etc.), while unspecified imports are listed separately. Table 2 shows total imports for each month when unspecified imports are combined with dynamically scheduled imports and pseudo-ties.

**Table 2: All Imports Shown on 2019 Month Ahead RA Plans by LSE Type (MW)**

LSE Type	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
IOU	1,398	1,134	1,337	935	1,434	2,068	3,061	3,505	3,664	1,953	800	1,318

<b>Total</b>	<b>2,014</b>	<b>1,803</b>	<b>1,910</b>	<b>1,590</b>	<b>2,501</b>	<b>3,472</b>	<b>4,954</b>	<b>5,238</b>	<b>5,928</b>	<b>3,362</b>	<b>1,793</b>	<b>1,897</b>

Table 3 shows the contribution of internal resources, imports, CAM, RMR, LCR and DR towards meeting RA requirements by LSE type. On aggregate, LSEs have met RA requirements in most months, though there was an approximately 500 MW cumulative deficiency in September resulting from the five LSE month ahead system deficiencies described in Section 4.

Since local RA requirements are based on a study of peak August load by the CAISO but applied to each month of the year, CPUC has adopted rules to count local resources

## The State of the Resource Adequacy Market - Revised

at their August NQC values for all months when evaluating compliance with local requirements. Therefore, Table 1 uses monthly values for resources with NQC values that vary, while Table 4 employs the CPUC counting convention of counting local resources at their August NQC values for all months in presenting similar information on resources procured to meet local RA requirements.

**Table 4: Resources Shown on 2019 Month Ahead Local RA Plans by LSE Type (MW)**

Table 5 shows the same resources as Table 4, but breaks down showings by local area rather than LSE type. Table 5 indicates that, despite the deficiencies described in Section 4, CPUC-jurisdictional LSEs have, in aggregate, provided sufficient capacity for all local areas except San Diego-Imperial Valley (San Diego-IV), which had deficiencies during the peak months of July through September and November.

<sup>4</sup> The San Diego-IV requirement varies by month because CPUC caps LSE local requirements at their system requirement.

### 3. RESOURCES PROCURED FOR RA-2020 YEAR AHEAD FILINGS

In year ahead filings, LSEs must demonstrate that they have procured resources that meet 90% of their RA requirements for the summer months of May through September. Although there were individual deficiencies, on aggregate CPUC-jurisdictional LSEs met the total CPUC year ahead RA requirement. Table 6 indicates that similar to 2019, the bulk of capacity procured by all LSEs is natural gas.

**Table 6: Resources Shown on 2020 Year Ahead (90%) System RA Plans by LSE Type (MW)**

Table 8 shows the contribution of internal resources, imports, CAM, RMR, LCR and DR towards meeting RA requirements by LSE type. On aggregate, each LSE type met year ahead system RA requirements. Overall about 70% of RA capacity is comprised of internal resources, 7-10% is imports, about 20% is CAM, RMR and LCR resources and the remaining 3% is IOU DR programs.

In Decision 19-02-022, the CPUC made two significant changes to local RA requirements for 2020. The biggest change is that there is now a three-year local RA requirement which requires each LSE to procure capacity to meet 100% of its local requirements for 2020 and 2021 and 50% of its local requirement of 2022. Table 9, 10, and 11 show the capacity procured to meet year ahead local requirements for 2020, 2021 and 2022, respectively. In aggregate, LSEs procured sufficient local MW to meet the applicable local RA requirements for each year. However, there were collective deficiencies among CPUC jurisdictional LSEs in some local areas as detailed below in Table 12.

The other significant change in RA requirements that was introduced for 2020 was the disaggregation of the “PG&E Other” area. Fresno, Humboldt, Kern, North Coast/North Bay, Sierra, and Stockton were previously aggregated to one “PG&E Other” local area for compliance purposes, whereas now, local RA requirements are assigned for each of the 10 local areas separately. For 2020, aggregate deficiencies among CPUC jurisdictional LSEs were seen for the Bay Area, Big Creek-Ventura, Kern, North Coast/North Bay, San Diego-IV, Sierra and Stockton local areas as depicted in Table 12.

As shown in Table 13, for 2021, LSEs were collectively able to meet local requirements in more local areas, though deficiencies were still present in the Kern, San Diego-IV, Sierra and Stockton local areas. Table 14 reflects the fact that no collective deficiencies were present for 2022, though LSEs were only required to meet 50% of the local requirement for Year 3.

## 4. DEVELOPMENT OF PREFERRED RESOURCES IN LOCAL AND SYSTEM AREAS

Resources must be on the Net Qualifying Capacity (NQC) List in order to be counted for RA. Table 15 identifies the new preferred resources that were added to the NQC list from August to December 2019. Only nine new preferred resources with a combined net dependable capacity of 136.1 MW were added during this period, however most are currently “energy only” resources so have NQC values of 0. Total August NQC added was 32.4 MW. All of these resources are contracted with IOUs.

**Table 15: New Preferred Resources on NQC List August-December 2019.**

Local Area	LSE Type	Resource ID	Resource Name	Technology	NQC	Net Dependable Capacity
Big Creek-Ventura	IOU	BGSKYN_2_BS3SR3	Big Sky Solar 3	Solar PV	5.4	20

## 5. LOCAL, SYSTEM AND FLEXIBLE RA DEFICIENCIES

On October 31, 2018, 10 of the 36 Commission-jurisdictional LSEs, submitted local waiver requests due to their inability to procure sufficient capacity in one or more local areas to meet their 2019 year ahead local RA requirements. These LSEs included:

- one IOU (San Diego Gas & Electric Company (SDG&E));
- six CCAs (East Bay Community Energy, Monterey Bay Community Power Authority, Peninsula Clean Energy Authority, San Jose Clean Energy, Sonoma Clean Power Authority, and Valley Clean Energy Authority); and
- three ESPs (Constellation NewEnergy, Inc., Direct Energy Business, and Just Energy Solutions, Inc. Additionally, a fourth ESP, Commercial Energy of Montana, was found to have a local deficiency but did not file a waiver).

This was not the first year that numerous LSEs have experienced difficulty procuring local capacity – but the underlying facts differed significantly from 2019. In the 2018 year ahead filings, most individual local deficiencies were concentrated in the San Diego-IV local area and were a result of LSEs’ inability to contract with Encina Generating Station due to the resource’ stated intent to retire at the end of 2017 in compliance with State Water Board once-through-cooling requirements. For 2019, local deficiencies were much more dispersed with deficiencies in the Other PG&E, Bay Area, LA Basin, and San Diego-IV local areas.

LSEs cited several reasons for these deficiencies in their local waiver requests. All of the LSEs issued Requests for Offers (RFOs) and/or bid into RFOs issued by other entities. While some were able to procure capacity, none of the LSEs seeking local waivers received enough to meet local RA requirements at prices they deemed reasonable. While some LSEs rejected offers they considered too high, many were unable to procure capacity even when they offered prices well above the local trigger price of \$40/kw-year. LSEs also reached out directly to generators, brokers, and other LSEs, but were unable to identify sufficient available capacity to meet their requirements.

Specific 2019 local deficiencies are detailed in Table 16. Despite these deficiencies, CAISO determined that there were no aggregate deficiencies in the SCE and SDG&E

## The State of the Resource Adequacy Market - Revised

---

TAC areas. The Humbolt, Sierra, North Coast/North Bay, Stockton, and Fresno local areas were still aggregated into the Other Pacific Gas & Electric (PG&E) area for 2019 RA compliance purposes. Despite collective deficiencies in several of these local areas, CAISO performed no backstop procurement.<sup>5</sup>

The year ahead local deficiencies generally persisted in month ahead filings, though some LSEs were able to cure their deficiencies in certain months. Additionally, a small deficiency occurred in Big Creek/Ventura for July that had not previously been present. Table 17 shows local deficiencies on month ahead showings from January through December 2019.

Table 18 shows system RA deficiencies in the year ahead (YA) and month ahead (MA) filings for 2019. Year ahead filings cover only the five summer months (May through September) so there were no deficiencies for off-peak months the year ahead timeframe. Even in the month ahead timeframe, deficiencies were minimal in those months. Larger deficiencies have been seen on the system level for the peak summer months, particularly July and September. While deficiencies were cured to some extent between the year ahead and month ahead filings, collective deficiencies of 159.15 MW for July and 847.02 MW for August remained for CPUC jurisdictional LSEs. A similar trend was seen for flexible deficiencies with a 114.1 MW deficiency remaining for September in the month ahead filings (Table 19).

On October 31, 2019, 20 of the 42 Commission-jurisdictional LSEs, submitted local waiver requests due to their inability to procure sufficient capacity to meet their 2020-2022 year ahead local RA requirements in one or more local areas. These LSEs include:

- two IOUs (Pacific Gas and Electric Company (PG&E) and San Diego Gas & Electric Company (SDG&E));
- nine CCAs (CleanPowerSF, East Bay Community Energy, Monterey Bay Community Power Authority, Peninsula Clean Energy Authority, Pioneer Community Energy, Redwood Coast Energy Authority, San Jose Clean Energy, Silicon Valley Clean Energy Authority, and Sonoma Clean Power Authority; and
- nine ESPs (Commercial Energy, Constellation NewEnergy, Inc., Direct Energy Business, EDF Industrial Power Services, Just Energy Solutions, Inc., Pilot Power Group, Shell Energy North America, Three Phases Renewables, University of California).

LSEs cited similar procurement challenges in their 2020-2022 waiver requests as in the 2019 requests, – especially tightness in the market and inability to find available capacity. The introduction of a multiyear requirement as well as disaggregation of the PG&E Other local areas appear to have been factors in the increased number of waiver requests for 2020-2022. As noted by PG&E in its Advice Letter submission, the total level of generating capacity available in the Kern, Sierra, and Stockton local areas is very close to the 2020 local requirement for those areas. Additionally, the local requirements were generated using the 2019 NQC list, so they do not reflect reduced solar and wind effective load carrying capability (ELCC) values adopted for 2020.

Table 20, Table 21, and Table 22 outline year ahead 2020-2022 local deficiencies. 2020 system and flexible deficiencies are described in Table 23. Note that these are

## The State of the Resource Adequacy Market - Revised

preliminary determinations as the year ahead compliance process has not yet been completed for 2020. LSEs will be given the opportunity to cure any deficiencies during this process.

## 6. RESOURCES NOT SHOWN IN YEAR AHEAD RA FILINGS

Table 24 depicts the amount of capacity internal to California that was not shown in 2020 year ahead RA filings. To calculate these values, the amount of resources under construction shown by LSEs in their year ahead filings was added to the amount of capacity listed on the 2020 NQC list. Resources shown by CPUC jurisdictional LSEs on year ahead RA plans, non-jurisdictional LSEs on year ahead supply plans and RMR resources were then subtracted from the total. (Demand response resources are not included since most are not listed on RA plans.) LSEs must meet 90% of their system requirements in the year-ahead process for the five summer months; thus, many of these resources would be expected to be shown in the month-ahead system RA process.

**Table 24: In State Resources not Shown on 2020 Year Ahead (90%) RA Filings (MW)**

	May	Jun	Jul	Aug	Sep
<b>Battery Storage</b>	4				
<b>Biogas &amp; Biomass</b>	222	176	173	173	181
<b>CDWR Pumps</b>	439	418	418	418	418
<b>CHP</b>	308	295	243	242	230
<b>Geothermal</b>	249	234	222	232	232
<b>Hydro</b>	2,342	1,895	2,396	2,195	1,760
<b>Natural Gas</b>	2,670	2,244	2,243	2,484	2,482
<b>Nuclear</b>	1,306	1,477	827	825	1,219
<b>Pumped Hydro</b>	575	110	85	74	42
<b>Solar</b>	488	254	277	310	173
<b>Wind</b>	455	377	262	271	182
<b>Total</b>	<b>9,057</b>	<b>7,480</b>	<b>7,146</b>	<b>7,224</b>	<b>6,918</b>

In addition to the internal resources listed above, Table 25 shows the unused maximum import capability (MIC) for the peak months of 2020 after imports of both CPUC jurisdictional and non-jurisdictional LSEs year ahead showings of import RA are accounted for. For September, which is forecast to be the peak load month of 2020, 4,368 MW of MIC were unused.

**Table 25: Remaining Import Capability (MW)**

	May	Jun	Jul	Aug	Sep
<b>Total MIC</b>	10,193	10,193	10,193	10,193	10,193
<b>CPUC Imports on RA Plans</b>	2,666	3,235	3,389	3,804	4,328
<b>Non-CPUC Imports on Supply Plans</b>	1,244	1,364	1,516	1,574	1,497
<b>Remaining MIC</b>	<b>6,283</b>	<b>5,594</b>	<b>5,288</b>	<b>4,815</b>	<b>4,368</b>

Table 26 compares the remaining internal capacity listed on the NQC list and unused MIC with the capacity needed for CPUC-jurisdictional LSEs to meet system RA requirement. While LSEs have already shown sufficient resources to meet requirements for May and June, additional resources must be shown to reach 100% of the requirement in July, August, and September. The system appears particularly tight in September where an additional 6,189 MW of capacity is needed out of a remaining 11,286 MW of remaining internal resources and MIC.

**Table 26: Remaining System Resources**

	May	Jun	Jul	Aug	Sep

## 7. CONCLUSION

Overall, the data provided in this report suggest that the RA market remains tight.

In 2019, 11 LSEs had year ahead local deficiencies, six had year ahead system deficiencies, and five had year ahead flexible deficiencies, and many of these deficiencies persisted through the year in month ahead filings. In addition, some LSEs reported being unable to identify available capacity at any price. September, which was the forecasted peak load month of 2019, proved to be the most challenging. Five LSEs had September 2019 deficiencies totaling 847.02 MW which resulted in a cumulative deficiency for CPUC jurisdictional LSEs for the first time.

This trend continued in the 2020 year ahead filings, in which, preliminarily, 20 LSEs had year ahead local deficiencies, five had year ahead system deficiencies, and four had year ahead flexible deficiencies. These totals may change once LSEs have had the opportunity to cure deficiencies.

Despite this increasing number of deficiencies, there does appear to be unused capacity in the system. An estimated 6,368 MW of unused capacity was listed on the NQC list for September 2019. While not all of this capacity was available (due to retirements, water limitations, etc.), it is highly likely that significantly more than 850 MW was physically available. Additionally, while a higher than normal amount of imports was shown for RA in September, 2,685 MW of MIC went unused.

Similarly, although there were system deficiencies in the 2020 year ahead filings, in aggregate LSEs were able to meet CPUC year ahead system RA 90% requirements as a result of some LSEs showing more MW than required. Additionally, for September 2020, there were 6,918 MW of capacity on the NQC list that was not shown and 4,368 MW of remaining MIC, although most of that capacity is needed to meet 100% month ahead RA requirements.

On a local level, however, it may not be possible for LSEs to meet requirements in all local areas due to a mismatch between 2020 local requirements and NQC values for solar and wind resources due to adoption of revised ELCC values and disaggregation of the PG&E Other local area. In addition, non-CPUC jurisdictional LSEs may have capacity in

these local areas that they are unwilling to sell because they do not have disaggregated local requirements.

One trend of note has been the increased use of imports to meet RA requirements, particularly among CCAs. Nearly 6,000 MW of import RA was shown on September 2019 RA plans, a significant increase over previous years. This was 13% of total capacity shown including 12% of IOU capacity, 15% of CCA capacity, and 13% of ESP capacity. In year ahead showings for September 2020, 17% of MW shown by CCAs were imports, compared with 8% for both IOUs and ESPs and 10% of total resources shown.

Although it appears that there is currently sufficient capacity on the system, and compliance with RA requirements is possible, we can expect that the market will continue to tighten. Few new resources came online in 2019 though more are expected in 2020 and beyond. As we move forward, it will be important to ensure that adequate resources are available to maintain local and system reliability and a robust RA market.
