August 2013
AMEC Project No. 1255400498
EXECUTIVE SUMMARY

At the request of Southern California Edison (SCE), AMEC Environment & Infrastructure, Inc. (AMEC) conducted focused surveys for the state and federally listed as endangered Least Bell’s Vireo (Vireo belli pusillus) and Southwestern Willow Flycatcher (Empidonax traillii extimus). Surveys were conducted at suitable habitat patches along the Valley-Ivyglen Transmission Line Project, Phase 1 (see Appendix A, Figures 1-3). These patches are locations where these subspecies have not been detected in previous survey years (AMEC 2007, 2009, 2010, 2011, 2012). The surveys were performed to satisfy requirements of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) (Riverside County 2003). One Least Bell’s Vireo territory was detected. No Southwestern Willow Flycatchers were detected.

1.0 INTRODUCTION

At the request of Southern California Edison (SCE), AMEC Environment & Infrastructure, Inc. (AMEC) conducted focused surveys for the state and federally listed as endangered Least Bell’s Vireo (Vireo belli pusillus) and Southwestern Willow Flycatcher (Empidonax traillii extimus). Surveys were conducted at suitable habitat patches along the Valley-Ivyglen Transmission Line Project, Phase 1 (see Appendix A, Figures 1-3). These patches are locations where these subspecies have not been detected in previous survey years (AMEC 2007, 2009, 2011, 2012). The surveys were performed to satisfy requirements of the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP) (Riverside County 2003). This report presents the findings of those focused surveys.

1.1 Project Description

The proposed project has been divided into two portions: eastern (Phase 1) and western (Phase 1I). Phase 1 extends from the Valley Substation in the City of Menifee southwest to the corner of Collier Avenue and Third Street in the City of Lake Elsinore. The Valley Substation is located in the City of Menifee on the west side of Menifee Road between McLaughlin and Ethanac Roads. Phase 2 extends from that corner northwest to the Ivyglen Substation in the City of Corona. The proposed project is designed to improve reliability and meet projected electrical load requirements in western Riverside County, and involves the eventual construction of a new 115 kilovolt (kV) transmission line between the Valley and Ivyglen Substations.

The proposed Phase 1 transmission line route (project) is located entirely in western Riverside County, California. It traverses portions of unincorporated county and the cities of Menifee, Perris, and Lake Elsinore (see Appendix A, Figure 1). The route traverses portions of the Lake Elsinore and Romoland United States Geological Survey (USGS) 7.5-minute series topographic quadrangles (see Appendix A, Figures 2-1 and 2-2).

This report concerns focused surveys conducted within the Phase 1 portion of the project area; Phase 2 will not be discussed further. Appropriate habitat was surveyed along the proposed transmission line right-of-way (ROW) and a 500-foot buffer from the centerline of the proposed ROW (study area), with the exception of areas that already have established occurrences of Least Bell’s Vireos.

The study area is located within the Western Riverside County Multiple Species Habitat Conservation Plan (MSHCP). The MSHCP is a comprehensive, multi-jurisdictional Habitat Conservation Plan, which focuses on conservation of species and their associated habitats in western Riverside County (Riverside County 2003).

1.2 Survey Areas

Areas considered to contain suitable habitat along the project route are:

1. Goldenrod Avenue: approximate UTM of survey area: Zone 11, 478950E, 3732690N (NAD27). This point occurs on lands mapped on the USGS 7.5 minute Romoland, Calif quadrangle.
2. **Alabaster Loop**: approximate UTM of survey area: Zone 11, 475389E, 3733085N (NAD27). This point occurs on lands mapped on the USGS 7.5 minute *Romoland, Calif* quadrangle.

3. **El Fresco**: approximate UTM of survey area: Zone 11, 478330E, 3732650N (NAD27). This point occurs on lands mapped on the USGS 7.5 minute *Lake Elsinore, Calif* quadrangle.

4. **Peach Street**: approximate UTM at north end of survey area: Zone 11, 472580E, 3730997N (NAD27); approximate UTM at south end of survey area: Zone 11, 472612E, 3730803N (NAD27). These points occur on lands mapped on the USGS 7.5 minute *Lake Elsinore, Calif* quadrangle. Report cover photo is of this survey area, taken from the south end looking north.

5. **Wasson Canyon**: approximate UTM at north end of survey area: Zone 11, 472339E, 3730799N (NAD27); approximate UTM at south end of survey area: Zone 11, 472425E, 3730494N (NAD27). These points occur on lands mapped on the USGS 7.5 minute *Lake Elsinore, Calif* quadrangle.

6. **Rosetta Canyon**: approximate UTM at west end of survey area: Zone 11, 469844E, 3729121N (NAD27); approximate UTM at east end of survey area: Zone 11, 469995E, 3729143N (NAD27). These points occur on lands mapped on the USGS 7.5 minute *Lake Elsinore, Calif* quadrangle.

Maps of the survey areas can be found in Appendix A, and photos of the survey areas can be found in Appendix E.

### 1.3 Species Information: Least Bell’s Vireo

Least Bell's Vireo (LBV) is a small, migratory, insectivorous bird which occurs in willow-dominated riparian habitats. Although this bird is drab in plumage and can be secretive within its densely vegetated habitat, males are easy to detect on the breeding grounds due to their conspicuous and diagnostic song. Nesting habitat of this species is restricted to willow and/or mulefat dominated riparian scrub along permanent or nearly permanent streams (Grinnell and Miller 1944, Goldwasser 1978, Franzreb 1987, Garrett and Dunn 1981).

Least Bell's Vireos were formerly widespread and common throughout low-lying riparian habitats of central and southern California, but are now restricted to a limited number of locations in southern California. Habitat reduction has contributed to this species' significant population declines. Nest parasitism by Brown-headed Cowbirds (*Molothrus ater*) has also seriously impacted reproductive success by Least Bell's Vireo, as well as many other species which build cup nests (Goldwasser 1978). The population is slowly recovering as a result of habitat restoration and cowbird control efforts. Least Bell's Vireo is listed as Endangered by the California Department of Fish and Wildlife (CDFW) and by the United States Fish and Wildlife Service (USFWS) (USFWS 1986). A final determination of critical habitat was made in 1994 (USFWS 1994). The project area is not within designated critical habitat for the Least Bell's Vireo.
1.4 Species Information: Southwestern Willow Flycatcher

The Southwestern Willow Flycatcher (SWF) is a small, brownish-olive flycatcher that was formerly considered a common summer resident in southern California’s lowland willow thickets and in low elevation mountain canyons (Garrett and Dunn 1981). Following the large-scale invasion of southern California by Brown-headed Cowbirds in the 1920s, along with loss of willow riparian habitat, this subspecies was nearly extirpated from southern California. The Willow Flycatcher was listed by the State of California as endangered in 1990. The subspecies \textit{E. t. extimus} (Southwestern Willow Flycatcher) is listed as federally endangered (USFWS 1995). Critical habitat was designated for this species in 1997 (USFWS 1997), then revised and finalized again in 2005 (USFWS 2005), then revised and finalized again in 2013 (USFWS 2013). The project area is not within currently designated critical habitat for the SWF.

Surveys have revealed populations along the Santa Margarita and San Luis Rey Rivers in San Diego County, in the San Bernardino Mountains and along the Mojave River in San Bernardino County, the Santa Ynez River in Santa Barbara County, the Santa Clara River in Los Angeles and Ventura counties, the South Fork of the Kern River in Kern County (Unitt 1987, Marshall 2000), and the Prado Basin and San Timoteo Creek in western Riverside County (J. Pike, Orange County Water District; R. McKernan, San Bernardino County Museum: pers. comm.). This subspecies also persists in the Lower Colorado River Valley (Marshall 2000, R. McKernan, pers. comm.). Unlike LBVs, SWF populations do not appear to have gained any significant benefit from habitat restoration and cowbird control efforts.

The Southwestern Willow Flycatcher breeds in dense riparian habitats near surface water or saturated soil. Plant composition and habitat structure can vary greatly depending on the site, but willows often make up much of the understory. Populations along the Colorado River are known to use thickets dominated by both native and nonnative plants (especially Salt-Cedar [\textit{Tamarix} spp.]). Dense patches of understory vegetation are a critical component of occupied habitat (Sogge et al. 1997).
2.0 METHODS

2.1 Least Bell’s Vireo and Southwestern Willow Flycatcher

In accordance with the currently accepted survey protocol for the Least Bell’s Vireo (USFWS 2001), each site was surveyed eight times by AMEC biologists. The LBV protocol requires surveys to be conducted at least 10 days apart from 10 April to 31 July. The SWF protocol requires five surveys, and that the first survey be performed from 15 May to 31 May, the next two surveys from 1 June to 24 June, and the final two surveys from 25 June and 17 July (Sogge et al. 2010), with at least five days between surveys. The SWF surveys were performed concurrently with LBV surveys.

Surveys consisted of slowly moving through the habitat while listening for the songs and calls of the two target species. During the SWF surveys, recordings of their vocalizations were broadcast as required by protocol. All bird species detected during the surveys were recorded in field notes and a list of them was compiled for Appendix B. Field forms for the SWF are presented in Appendix C.

Due to the small size of the riparian patches, all areas were surveyed in a single morning on each visit. Surveys were performed by Stephen J. Myers (TE804203) and John F. Green (TE054011). Table 1 summarizes the surveys. The survey areas are illustrated in Appendix A on Figures 2-1 and 2-2 (USFWS required topographic maps) which correspond to Figures 3-1 through 3-6 (aerial photos).

Notes:
† SWF and LBV surveys conducted concurrently. Other surveys were for LBV only.
3.0 RESULTS

3.1 Habitat Description

The six survey areas are all vegetated with plants typical of lowland riparian areas in Southern California, including willows (*Salix* spp.), Mulefat (*Baccharis salicifolia*), and Fremont Cottonwoods (*Populus fremontii*).

The *Goldenrod Avenue* survey area was part of a poorly defined drainage in the past (judging from topographic maps and old aerial photos), but probably did not support riparian vegetation. Runoff from new housing developments has created and sustained this patch, and surface water was present throughout the survey season.

The *Alabaster Loop* survey area is on a former USGS mapped blueline intermittent stream, but again likely did not support riparian vegetation in the past. The drainage was highly modified by development, and the riparian patch is sustained by runoff. Surface water was present throughout the survey season.

The *El Freso* survey area is in a small, narrow canyon above a USGS mapped, intermittent, unnamed stream. It appears to be supported by groundwater and/or runoff from an adjacent rural residence, but no surface water was visible during the season.

The *Peach Street* survey area was also part of a poorly defined drainage in the past, which probably did not support riparian vegetation. It is split by Highway 74, which it crosses under through a culvert. Runoff from Highway 74 and rural residential in the area has sustained the riparian vegetation here, but drought conditions this year resulted in no surface water present during the survey season. Some riparian vegetation near Highway 74 was damaged/removed from the north patch prior to the survey season, possibly for flood control maintenance.

The *Wasson Canyon* survey area is in a relatively large and well defined drainage mapped by the USGS as an intermittent stream. It is split by Highway 74, which it crosses under through large culverts. It gains some water through runoff from Highway 74 and rural residences, but rarely contains surface water, and contained none during this season. It may have historically sustained riparian vegetation.

Finally, the *Rosetta Canyon* survey area was part of yet another poorly defined drainage in the past which probably did not support riparian vegetation. It is split by Highway 74, which it crosses under through a culvert. Runoff from Highway 74 and rural residences and businesses now sustain riparian vegetation on the north side of the highway, and a new patch has developed on the south side which was once scraped bare (several years ago). Surface water was present throughout the survey season.

Appendix A has maps of the survey areas and Appendix E has photographs of them.
3.2 Survey Results

Sixty-two bird species were detected during the 2013 Phase 1 riparian birds focused surveys. Among them were the following birds that are typical of lowland riparian habitats in southern California: Mourning Dove (*Zenaida macroura*), Black-chinned Hummingbird (*Archilochus alexandrini*), Nuttall’s Woodpecker (*Picoides nuttallii*), Black Phoebe (*Sayornis nigricans*), Bushtit (*Psaltriparus minimus*), House Wren (*Troglodytes aedon*), Yellow Warbler (*Setophaga petechia*), Common Yellowthroat (*Geothlypis trichas*), Song Sparrow (*Melospiza melodya*), and Lesser Goldfinch (*Spinus psaltria*). A complete list is attached as Appendix B.

3.2.1 Southwestern Willow Flycatcher

No Southwestern Willow Flycatchers or any other subspecies of Willow Flycatcher were detected at any of the survey areas.

3.2.2 Least Bell’s Vireo

A single, singing Least Bell’s Vireo was detected on multiple survey days at the northern patch of the Rosetta Canyon survey area (see Appendix A, Figure 3-6). Only the singing male was ever seen/heard; breeding success is unknown.

Were any Willow Flycatchers color-banded? Yes _No:_ N/A

If yes, report color combination(s) in the comments section on back of form and report to USFWS.

Reporting Individual: John F. Green  Date Report Completed: 16 July 2013
US Fish and Wildlife Service Permit #: TE054011  State Wildlife Agency Permit #: SC-001951
Submit form to USFWS and State Wildlife Agency by September 1st. Retain a copy for your records.
Fill in the following information completely. Submit form by September 1st. Retain a copy for your records.

Reporting Individual: John F. Green Phone # 951-369-8060
Affiliation: AMEC E-mail: John.F.green@amec.com
Site Name: Valley - Jurglen Phase 1, Goldenrod Ave. Date Report Completed: 16 July 2013
Was this site surveyed in a previous year? Yes ✓ No ___ Unknown ___
Did you verify that this site name is consistent with that used in previous years? Yes ✓ No ___ Not Applicable ___
If site name is different, what name(s) was used in the past?
If site was surveyed last year, did you survey the same general area this year? Yes ✓ No ___ If no, summarize below.
Did you survey the same general area during each visit to this site this year? Yes ✓ No ___ If no, summarize below.
Management Authority for Survey Area: Federal ___ Municipal/County ___ State ___ Tribal ___ Private ___
Name of Management Entity or Owner (e.g., Tonto National Forest) Unknown
Length of area surveyed: 0.04 ___ (km)

Vegetation Characteristics: Check (only one) category that best describes the predominant tree/shrub foliar layer at this site:

✓ Native broadleaf plants (entirely or almost entirely, > 90% native)

Mixed native and exotic plants (mostly native, 50 - 90% native)

Mixed native and exotic plants (mostly exotic, 50 - 90% exotic)

Exotic/introduced plants (entirely or almost entirely, > 90% exotic)

Identify the 2-3 predominant tree/shrub species in order of dominance. Use scientific names. Salix spp., Baccharis salicifolia

Average height of canopy (Do not include a range): 5 ___ (meters)

Attach the following: 1) copy of USGS quad/topographical map (REQUIRED) of survey area, outlining survey site and location of WIFL detections; 2) sketch or aerial photo showing site location, patch shape, survey route, location of any detected WIFLs or their nests; 3) photos of the interior of the patch, exterior of the patch, and overall site. Describe any unique habitat features in Comments.

Comments (such as start and end coordinates of survey area if changed among surveys, supplemental visits to sites, unique habitat features. Attach additional sheets if necessary

Survey times are for full morning, including visits to other patches.
PDT = Pacific Daylight Time

**Overall Site Summary**

Totals do not equal the sum of each column. Include only resident adults. Do not include migrants, nestlings, and fledglings.

Be careful not to double count individuals.

**Total Survey Hours:** 11, 25

Were any Willow Flycatchers color-banded? Yes No

If yes, report color combination(s) in the comments section on back of form and report to USFWS.

Reporting Individual: John F. Green Date Report Completed: 16 July 2013

US Fish and Wildlife Service Permit #: TE064011 State Wildlife Agency Permit #: SC-001951 attachment

Submit form to USFWS and State Wildlife Agency by September 1st. Retain a copy for your records.
Fill in the following information completely. Submit form by September 1st. Retain a copy for your records.

Reporting Individual: John F. Green
Affiliation: AMEC
Site Name: Valley-Ivy Glen Phase 1, Wassen Cape
Was this site surveyed in a previous year? Yes ☑ No No Unknown
Did you verify that this site name is consistent with that used in previous years? Yes ☑ No No Not Applicable
If site name is different, what name(s) was used in the past?
If site was surveyed last year, did you survey the same general area this year? Yes ☑ No No If no, summarize below.
Did you survey the same general area during each visit to this site this year? Yes ☑ No No If no, summarize below.
Management Authority for Survey Area: Federal ☑ Municipal/County ☑ State ☑ Tribal ☑ Private ☑
Name of Management Entity or Owner (e.g., Tonto National Forest): Unknown
Length of area surveyed: 0.32 (km)
Vegetation Characteristics: Check (only one) category that best describes the predominant tree/shrub foliar layer at this site:
☑ Native broadleaf plants (entirely or almost entirely, > 90% native)
☐ Mixed native and exotic plants (mostly native, 50 - 90% native)
☐ Mixed native and exotic plants (mostly exotic, 50 - 90% exotic)
☐ Exotic/introduced plants (entirely or almost entirely, > 90% exotic)
Identify the 2-3 predominant tree/shrub species in order of dominance. Use scientific names. Salix spp., Baccharis salicifolia
Average height of canopy (Do not include a range): 12 (meters)
Attach the following: 1) copy of USGS quad/topographical map (REQUIRED) of survey area, outlining survey site and location of WIFL detections; 2) sketch or aerial photo showing site location, patch shape, survey route, location of any detected WIFLs or their nests; 3) photos of the interior of the patch, exterior of the patch, and overall site. Describe any unique habitat features in Comments.

Survey times are for full morning, including visits to other patches.
PDT = Pacific Daylight Time

## Appendix 1. Willow Flycatcher Survey and Detection Form

**Willow Flycatcher (WIFL) Survey and Detection Form (revised April 2010)**

Site Name: Valley-Ivy Glen, Phase I, Rosetta Cyn, State: CA
USGS Quad Name: Lake Elsinore, County: Riverside
Elevation: 425 (meters)
Creek, River, Wetland, or Lake Name: unnamed

Is copy of USGS map marked with survey area and WIFL sightings attached (as required)? Yes X No

Survey Coordinates: Start: E 469844 N 3729121 UTM Datum: NAD27 (See instructions) Stop: E 469995 N 3729143 UTM Zone: 11

If survey coordinates changed between visits, enter coordinates for each survey in comments section on back of this page.

**Fill in additional site information on back of this page**
