Promoting Plug-in Vehicles

Reduce GHG and electric rates

Snuller Price, Partner

Eric Cutter, Senior Consultant

State Interest in EVs

- + **2013 ZEV Action Plan**
 - 1.5 million by 2025
- + **ZEVs are necessary to meet the 2050 GHG targets**
- + **State needs utility support of plug-in vehicle policies**
- + **E3 believes there is now an opportunity to really push the plug-in market**
 - Viable PEVs on the market
 - Electricity getting cleaner
 - Utilities need off-peak load

Reducing carbon in 2050

Carbon Savings for 2050 Reductions

Zero-carbon electricity generation is the dominant energy source in this 2050 economy. The constraints on other low-carbon resources drive low-carbon electricity to be the fuel of choice.

How do we transform the market?

#1 Provide incentives to reduce the upfront cost of the plug-in vehicles to the consumer

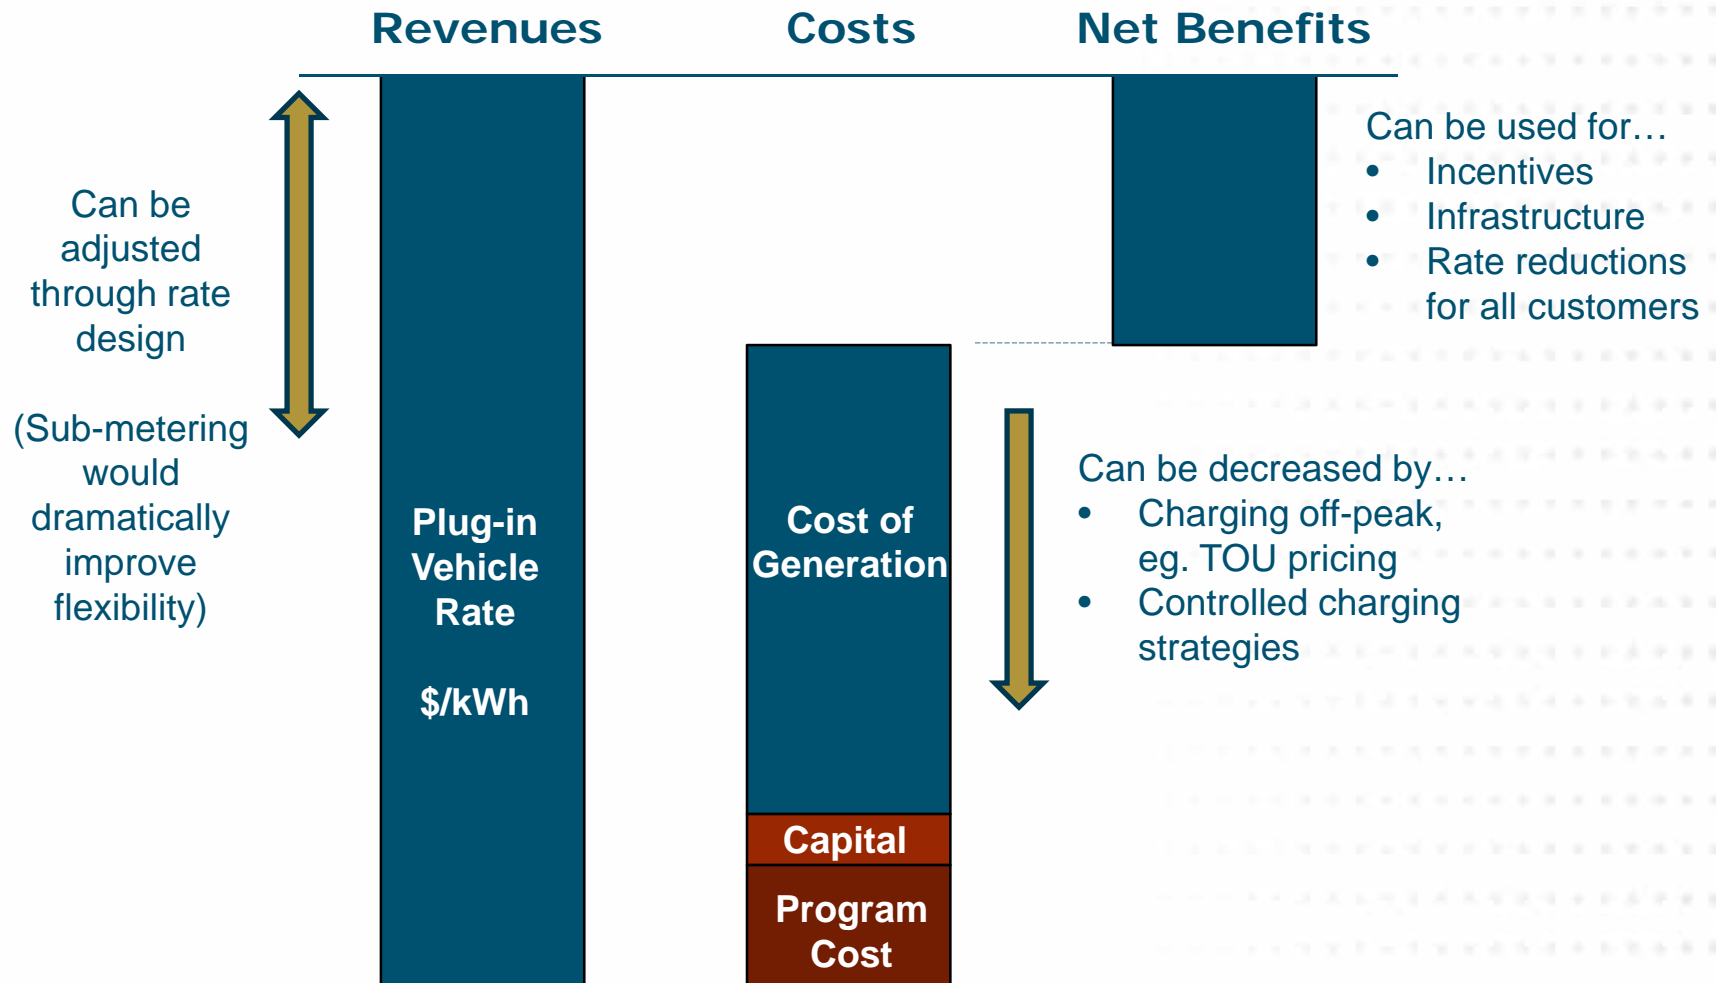

- Incentives that can be funded by utility ratepayers fall into three categories which can be used in combination
 - Ratepayer benefits (incentive is collected back from grid benefits)
 - Participant funding (upfront incentive is collected back over time in the plug-in vehicle rate)
 - Market transformation subsidies (similar to CSI)

#2 Encourage the availability of charging

- Develop multi-family infrastructure strategy
 - Building standards, incentives to landlords, or utility construction

Benefits of EVs to Ratepayers

Example – NPV of Ratepayer Benefits

- + At plug-in charging rates of \$0.10/kWh to \$0.20/kWh, revenue neutral ratepayer costs can range from \$1,000 to \$3,000 per vehicle
- + At this electricity charging cost, plug-in vehicles still save plug-in owners ~\$1,000

| | Low Rate | Med Rate | High Rate |
|-----------------------|----------|----------|-----------|
| Off-peak Rate \$/kWh | \$ 0.10 | \$ 0.12 | \$ 0.20 |
| Off-peak Cost \$/kWh | \$ 0.05 | \$ 0.05 | \$ 0.05 |
| Difference \$/kWh | \$ 0.05 | \$ 0.07 | \$ 0.15 |
| CTF \$/Year | \$ 183 | \$ 256 | \$ 548 |
| 7 year NPV \$ | \$ 950 | \$ 1,330 | \$ 2,850 |
| Gasoline Savings | \$ 1,579 | \$ 1,579 | \$ 1,579 |
| Plug-in Electric Cost | \$ 365 | \$ 438 | \$ 730 |
| Plug-in Savings | \$ 1,214 | \$ 1,141 | \$ 849 |

Assumptions

| | |
|------------------------|--------|
| Discount Rate | 8% |
| Gasoline Cost | \$3.75 |
| miles / kWh | 3 |
| conventional miles/gal | 26 |
| kWh/day | 10 |
| kWh/year | 3,650 |

Transformation in Phases

+ Early Path

- Provide ratepayer funded incentive to reduce upfront cost of vehicles to increase adoption, funded by net system benefits
- Use TOU pricing (or a simple load-control signal) to encourage super-off peak charging with simple timers or onboard charge controllers in the vehicles

+ Mid Term

- Expand charging availability for multi-family and workplace charging through (a) new construction standards, (b) incentives and (c) possibly utility 'make ready' construction
- Transition to using system benefits to lower retail electric rates

+ Long term

- Expand charging infrastructure for 'range anxiety' of pure EVs
- Create dynamically controlled charging for additional grid benefits after significant plug-in vehicle penetration is achieved

Plug-in Hybrids in Early Phase

+ In near-term PHEVs ideal transition strategy

- No range anxiety
- Need only level 1 charging
- Very low cost of infrastructure upgrades with off-peak charging

+ Infrastructure needed for PHEVs

- Existing distribution largely can accommodate PHEVs, particularly with night time charging
- Multi-family charging locations (landlord / tenant problem)
- Public charging stations helpful, but not as critical for vehicle purchase

Summary

- + Plug-in vehicles are important to achieve California's long-term CO2 goals**
- + Increased use of existing electricity grid in the off-peak produces benefits that can be used to transform the market or reduce rates for all customers**
- + Implementation: Keep it simple**
 - Upfront incentives, TOU pricing and/or simple load control in the near term
 - Expand charging access, in particular in the multi-family segment
